Science is our best bet for estimating short- and long-term probabilities of a given course of action ([Kauffman and Farkas, 2022](#)), and sometimes the probable long-term consequences are the more important. The Covid-19 pandemic of 2020 put this into sharp relief for the welfare and safety of societies in general and school children in particular ([Kauffman and Badar, 2023](#)). The world-wide movement toward full inclusion illustrates the problem of immediate versus long-term consequences in special and inclusive education ([Kauffman et al., 2020a,b](#)).

As we understand success in school, it means that students learn a curriculum that is judged appropriate for them. If we define success in that manner, then we suspect that the probability of success for students with disabilities declines as the teacher's competence decreases, the number of students in the class increases, and as the severity of disability increases. That is, success for students with disabilities is very likely positively correlated with teacher competence and negatively correlated with class size and severity of disability.

Besides our hypotheses regarding school success of students with disabilities, we think inclusive and special education suffers because of many confusions about inclusive education and myths about special education. That is, special and inclusive education is often misunderstood because of lack of clarity, overconfidence in fast, intuitive, and emotional thinking, and failure to think deliberately about it and the evidence that supports and refutes it ([Kahneman, 2011](#)).

Confusions about inclusion

Common confusions about inclusion are apparent in the literature—confusion about definitions, rights, identification, peers, etiology, intervention models, goals, curricula, reality, finance, means and ends, and research evidence.

The 12 confusions depicted in [Fig. 1](#) are briefly outlined below with further details provided in [Hornby \(2014, 2015\)](#).

Definitions

The term *inclusion* is used in various ways, for example, to refer to inclusive schools or an inclusive society. There is also confusion of social inclusion with inclusive education for children with disabilities. Social inclusion in education refers to inclusion in mainstream schools of children with a wide diversity of differences, such as race, sexual orientation, and religions. But disabilities are a different kind of diversity requiring a totally different response from the education system. Nevertheless, proponents of full inclusion confuse disabilities with other forms of diversity, treating diversities as if they all mean the same thing as far as the students with disabilities' education is concerned.

Fig. 1 Confusions about inclusion. Based on Hornby, G., 2014. *Inclusive Special Education: Evidence-Based Practices for Children with Special Needs and Disabilities*. New York: Springer; Hornby, G., 2015. Inclusive special education: development of a new theory for the education of children with special educational needs and disabilities. *Br. J. Spec. Educ.* 42, 234–256.

Rights

The committee that monitors the implementation of the UNCRPD has radically reinterpreted Article 24's *right to education* as a *right to inclusive education* (Anastasiou et al., 2018). In implementation of the requirements of UNCRPD Article 24 General Comment Number 4, the Committee de-emphasizes the importance of learning, avoiding reference to specially designed instruction, special education teachers, and even co-teaching (Hyatt and Hornby, 2017; UNCRPD, 2016). In addition, it weaponizes school inclusion against special education settings (Anastasiou et al., 2020). However, the right to education takes on its full meaning, only if it includes a *right to learn*, and the right to learn is not the same as the right to educate in the same environment (Anastasiou et al., 2018; Warnock, 2010). Furthermore, in all international law treaties, the right to education is considered a *human social right* aimed at ensuring socio-economic justice among all persons with disabilities, including those with mind-related disabilities. The anti-discrimination paradigm, which the UNCRPD Committee promotes, is inspired by the tradition of individual rights (e.g., right to life, equal recognition before the law), prioritizing sameness of educational treatment for people with disabilities. Thus, although their human rights allow students with disabilities to be educated alongside their mainstream peers, for some of them this may not, morally, be the best option. As Warnock puts it, "What is a manifest good in society, and what it is my right to have ... may not be what is best for me as a schoolchild" (2010, p. 36). Placement in a general education classroom is not enough to do justice to persons whose impairments cannot be addressed by mere access to education (Anastasiou and Bantekas, in press; Anastasiou et al., 2018).

Identification

To supporters of the inclusion of all students in general education, with no exceptions, identification can result in labeling children with disabilities, thereby stigmatizing them, and therefore should be avoided. However, if children *are* identified as having disabilities, there is a risk of negative labeling, while if they are *not* identified there is a risk that their special needs will not be met. Also, being stigmatized is not necessarily a result of identification but the fact that their disabilities themselves mark them out as different from other children in some way (Kauffman, 1989, 2005, 2008; Kauffman and Badar, 2013).

Peers

Another confusion is related to one of the proposed hallmarks of inclusive education, that children with disabilities are educated alongside their age peers in mainstream classrooms. However, many children with disabilities are more comfortable alongside peers with shared interests and similar abilities or disabilities to themselves, than alongside peers who do not have similar disabilities and merely have the same chronological age. As Warnock pointed out, "Inclusion is not a matter of where you are geographically, but where you feel you belong" (2010, p. 34).

Etiology

Over the past few decades, awareness has grown about how social and environmental factors can influence children's development and functioning. However, some proponents of full inclusion have taken this social perspective to its extreme to suggest that disabilities are entirely socially constructed and to deny the impact that impairments can have on children's learning (Hughes and Patterson, 1997; Oliver, 1992; see also Anastasiou and Kauffman, 2011).

Intervention models

It is sometimes suggested that special education is based solely on a medical or deficit model. In fact, special education interventions are influenced by educational, psychological, sociological, sometimes by medical approaches as well as other not easily classified treatment models with a particular focus on evidence-based practices as well as law and social policy. No matter the theoretical starting point (e.g., applied behavioral analysis, cognitivism, Piagetian or Vygotskian approaches, information processing theory, social learning theory, systems theory), it is the research evidence within a context of human dignity and continuous monitoring, that provide an objective way to evaluate intervention approaches (Wiley et al., 2019). This is an important aspect of special education because of the persistence of a plethora of controversial interventions, such as gentle teaching, learning styles, facilitated communication and other interventions lacking support of research evidence (Fox and Mulick, 2016).

Goals

Including students with disabilities in mainstream schools driven by the need to achieve high predetermined academic standards (e.g., age-level Common Core Standards) results in the goals of education for many of these children being inappropriate. Instead, the main goals of education for students with disabilities should be tailored to their special needs to "... assist them to become economically active and provide them with the skills needed in everyday life, offering training in skills which respond to the social and communication demands and expectations of adult life." (UNESCO, 1994, p. 10). This becomes even more an issue with students who have severe disabilities (Kauffman et al., 2020c).

Curricula

Supporters of full inclusion demand that *all* children with disabilities should be entitled to have access to the same curriculum as other children. However, inclusion in a mainly academic curriculum that is unsuitable for the learning needs of many students with disabilities may contribute to the development of emotional or behavioral difficulties that can lead to their being disruptive and being excluded from schools. The priority for children with disabilities must be that they have access to curricula that are appropriate for them, not that they are fitted into a curriculum that was designed for the mainstream population (Fuchs et al., 2014; Kauffman et al., 2020c, 2019).

Reality

Full inclusion requires that *all* children with disabilities be educated in mainstream classrooms. However, the reality of the situation in most mainstream schools is that, because of insufficient input on teaching students with disabilities in initial teacher education courses, limited in-service training, insufficient material and financial resources, and insufficient support staff, many teachers do not feel able to effectively implement even a policy of temperate inclusion (Farrell, 2010; Mitchell, 2019).

Finance

A key controversy is about the relative cost of provision for students with disabilities in mainstream or special facilities. At first sight special schools, special classes and resource rooms appear more expensive, so inclusive education seems to be the cheaper option (OECD, 1999). However, if the education system does not enable young people with disabilities to achieve independence after they leave school, then the cost to society will be far higher in long-term welfare payments.

Means and ends

An important confusion is whether inclusion is a means to an end or an end in itself. Proponents of full inclusion argue that any separate placement is morally wrong because a key goal of education should be to fully include individuals in the community in which they live. Therefore, the argument goes, they ought to be included in their local mainstream schools. However, inclusion in the community after leaving school is the most important end that educators should be seeking. Inclusion in mainstream schools may be a means to that end but should not be an end in itself. A dedicated, separate setting is also a means to that end, not an end in itself.

Fig. 2 Myths about special education. Based on Kauffman, J.M., Schumaker, J., Badar, J., Hallenbeck, B.A., 2018. Where special education goes to die. *Exceptionality*, 27, 149–166.

Research evidence

There is confusion about the research base for inclusive education, with many supporters of inclusion appearing to believe that an adequate research base for the effectiveness of inclusive schools already exists. However, reviews of the research evidence in support of inclusion to date have been inconclusive, suggesting that an adequate research base for inclusion has not been established (Cook and Cook, 2020; Farrell, 2010; Fuchs et al., 2022; Kauffman and Hornby, in press; Lindsay, 2007).

Myths about special education

The possible future of special education is not entirely clear, and some have speculated about how it might be devalued or even die (e.g., Hyatt and Hornby, 2017; Kauffman, 2022; Silvestri and Heward, 2016). Kauffman et al. (2018c) have suggested 12 common myths that may contribute to its demise. The 12 myths discussed briefly below are depicted in Fig. 2.

Special education isn't actually special, it's just good teaching

We have previously noted this myth in our discussion of specialization. The idea that teaching is teaching—that if you can teach one student you can teach any student, or that what you can teach in one setting you can teach in any setting, or that if you can teach one thing you can teach anything—reflects a profound misunderstanding and oversimplification of teaching and learning. Special educators need to have special teaching skills (Kauffman et al., in press).

Special education does not close the achievement gap

As we have long known, the goal of closing the gap between the mean achievement of those with and those without disabilities is irrational and demonstrates misunderstanding of the implications of educational disability (Kauffman, 2005). The gap that can and should be closed is that between what students with disabilities are capable of achieving with support and what they do in fact achieve (Kauffman, 2008). Special education is designed to close that and only that gap.

Special education creates low expectations

Regrettably, many people have lower expectations of students with disabilities than those students can achieve, sometimes because of bias, prejudice, and malicious ableism. Many people have unreasonably high expectations of students with disabilities. Getting expectations just right for individual students is not easy (Kauffman and Landrum, 2018). In short, there is no evidence that special

education creates low expectations, although reasonable expectations for students with disabilities may well be lower than those for students without disabilities.

Special education promotes “deficit thinking”

Deficit thinking rhetoric implies that special educators, or even general educators, tend to see only deficits in students with disabilities. Such rhetoric in disability studies (e.g., [Dinishak, 2016](#)) is a favorite linguistic tactic used to neutralize the specific characteristics of disability and neglect the need for dedicated care of those needing special education services ([Anastasiou and Kauffman, 2019](#)). The IDEA definitions of disability categories have a standardized structure. They first describe an extraordinary human condition in terms of impairment, disability, low functioning, deficit or disorder, and then emphasize that these conditions adversely affect a child’s educational performance ([Anastasiou and Kauffman, 2019](#)). In education—contrary to medicine—disability itself is not the special educator’s interest. *If the condition does not affect a child’s educational performance, then it is not a disability for special education purposes.* This is an educational-legal model tailored to school learning. Deficit thinking rhetoric manipulates language to attack the legally defined identification process of students with disabilities ([Anastasiou and Kauffman, 2019](#)). When students with disabilities do have impairments in learning, then and only then should educators have a special system to support them, and that system is special education. Denying special educational needs or denying what students with disabilities can achieve under optimal instruction is not helpful. What is helpful is seeing realities, avoiding the traps of overestimation and underestimation of skills, finding students with disabilities’ strengths that help them reduce any possible learning deficit or gap, and enabling them to do more things that promote their independence and welfare. One’s specific ability to do more things does not make a person more valuable as a human being; all persons have equal value. Malicious ableism—underestimating the value or abilities of students with disabilities—should be fought within school and community.

Identifying disabilities is a big problem

Identifying disabilities is sometimes difficult, but identification is not the biggest problem. In fact, denial of disability may be more common than difficulty in identification, especially when the disability is not obvious. The biggest problem is making certain that all students with disabilities receive appropriate instruction ([Kauffman et al., 2018c](#)).

Disabilities are just diversity

Disabilities are, indeed, a kind of diversity. However, they are not like any other kind of diversity when it comes to education. It is most obviously different from diversities of color, nation of origin, culture, heritage, size, age, religion, sexual orientation, and many other diversities requiring different responses from educators ([Anastasiou and Kauffman, 2012](#)).

Special education should be based on values, not science

Values are, indeed, very important. Valuing individuals for whom they are and valuing abilities are essential in education. However, in the matter of instruction, scientific evidence must supplement and direct the value of educators for learning ([Kauffman and Farkas, 2022](#); [Wiley et al., 2019](#)).

Special education does not work if separate from general education

Separation of students with disabilities from general education does not prevent special education from “working” in the sense of helping students with disabilities learn appropriate skills. Separate education can only be said not to “work” in that it does not fit the inclusionist model of locating the students with disabilities in general education. For some students with disabilities, special education offered in the general education classroom does not “work” in the sense of being the place the students with disabilities will be most successful in learning the appropriate curriculum ([Kauffman and Hornby, in press](#); [Fuchs et al., 2022](#); [Kauffman et al., 2018c](#)).

We had better prepare all educators to teach all kids

Preparing all educators to teach all students is similar to the idea of preparing all members of any profession or line of specialized work to perform competently in every case or job they might encounter. The idea is contrary to the notion of specialized training and competence. Students, including students with disabilities, deserve teachers with training appropriate for their learning needs ([Kauffman et al., in press](#)).

Special education teachers need to adjust teaching to kids’ learning styles

Learning styles is one of many ideas that have intuitive appeal, but are not supported by scientific evidence. The effectiveness of adjusting instruction to accommodate “learning styles” of students with disabilities is not supported by corroborating evidence ([Riener and Willingham, 2010](#)).

Restructuring is the key to improving schools

Restructuring in the form of rearranging duties and responsibilities or other combinations of responsibilities of staff, movement of students, changing hours or calendar, and so on are highly unlikely to significantly improve school learning. Improving instruction based on scientific evidence is the key to improving school learning. Cultural and organizational changes can shape conditions of instruction, but there is no silver bullet from outside that will automatically solve learning problems.

Special education was created by educators, not parents

Many educators have been advocates for students with disabilities and their appropriate education. However, the support and advocacy of parents have been the most critical factors in the creation of special education law, local policy, and the provision of many specialized facilities (see [Martin, 2013](#)).

Conclusion and the way forward for special and inclusive education

There has now been more than 25 years of promotion of an inclusion agenda without producing convincing research evidence that it is superior to alternatives ([Cook and Cook, 2020](#); [Fuchs et al., 2022](#)), or that any country or region has been able to effectively educate *all* students with disabilities in mainstream classrooms. It is therefore considered that it is well overdue time to move beyond controversy and debate on this issue in order to establish a new way forward in the education of students with disabilities. This will involve a more temperate approach to inclusion that combines the best elements of special education with those of inclusive education ([Gordon-Gould and Hornby, 2023](#); [Hornby, 2015](#); [Kauffman et al., 2018a](#)).

Within this we consider that the highest value should be placed on the learning of students with disabilities, not on their bodily presence in a particular place, such as the general education classroom. Inclusion is an important value, but we conclude that it should mean inclusion in appropriate learning, wherever that learning occurs. All students with disabilities are entitled to an education that is appropriate for them, and sometimes this is best delivered in a separate setting outside the general education classroom.

I have a problem

I have to write
a chapter
about
special needs
even though
I do not know
what they are
and simply
have to rely on
no one else
knowing
what they are
either

Words?

Things have to start somewhere, don't they? This chapter for example, has begun with a sort of poem. The idea didn't come from nowhere though. Poetry isn't short on history. I am just one in a long line of millions who have written it. It is what it is because we have shared and talked about it a multitude of times in so many contexts over millenia. As a reader there are numerous ways in which you might have responded, but you will have had an immediate response. This may have leaned toward a sense of positivity or negativity or amusement or annoyance or ... well the list is full of endless permutations. And it will have been informed by your relationship with the history of the thing we call poetry (in English).

Of course your response would have been informed by your relationship with the history of a great many other things too. For example your perspective on what special needs are; and your perspective on what an encyclopedia chapter should be like. You may, for instance, have had a very particular response to the use of "I" at the start of a chapter. You may have presumed a kind of expertise in the author that would not have used the first person or claimed to be ignorant about the thing they are writing about.

Words. We always begin with a response ... even if it is not much of a response at all. And that response is buried in a huge interwoven melee of personal, cultural, environmental experiences. Special Needs—2 words, together and apart, you and they bring with them so much meaning.

- Since it comes first, let us start with special. What is "special"? Are you special good or special bad? Are you labeled special or are you claiming special? Are you special as a difference from others or as a difference within yourself? Are you special across all contexts or in all cultures or just in some? Are you special in a way that brings you access to resources or are you special and it does not? Are you special for all time or for just some of it? Is anyone else special like you? Can your specialness be shared or is it unique? Does it rub off or encompass people associated with you? Are you special to everyone or just to some people? Can your specialness be measured? Can it be proven? Can it be explained? Are some parts of you more special than other parts? Does the

answer to all these questions change, so you can be both special good and bad, labeled and claiming, different from and within ... and so forth. And finally (if there really can be a finally) where does your special come from? Is it real or is it constructed?

- What about “needs”? Does the word coming second to “special” tell us something about the needs themselves? Who decides about these needs? Do you identify your needs or does someone else? Are they expressed or are they inferred? Are they relative to others or fundamental to you? Are the needs a result of something in you or something in what you have been provided with? Are your needs a strength or a weakness? Are the needs individual to you, shared with others, or collective needs? Are these needs in all aspects of your life or just in some? Are they developmental or developed? Who needs these needs? Are your needs actually priorities?

As these questions are intended to show, how we use each term will have a complex history and a complex web of meanings which make any simple understanding of them nigh on impossible. This is made even more complex when we combine them. All of which is ironic of course, because “She’s got special needs,” is supposed to make things much clearer.

History?

I am by no means the first person to raise these kinds of issues, of course. For example as part of three short articles in which he critiqued both inclusion and special needs, Wilson (2002) asked a series of questions about special needs, noting its ambiguity of meaning as well as some underlying assumptions associated with it. He pointed out that special needs requires an other to be special to. It therefore requires reference to criteria associated with something generally seen to be desirable, important and necessary. This is bound to vary within and between systems and cultures. Neither specialness nor neediness can ever be attributes of the person except within a relational context. This is true about all human experience of course, which always exists in relationship to others. As such it will be subject to the power which exists within relationships, in the give and take between us (Foucault, 1980, 1982). In the context of special needs it is fair to suggest that there is greater power for those who define the criteria of specialness and neediness than those to whom the criteria are applied. This reflects the “irresolvable contradiction” which Oliver (1996) pointed out.

To put it bluntly, people in need of care cannot be empowered because the reason that they need care is precisely because they are powerless;- if they were not, why would they need care?

These contradictions and negative connotations have been discussed for decades. For example, Tomlinson (1982) pointed to Rousseau’s use of needs in his 1762, treatise on Education, *Emile*, [*N’accordez rien à ses désirs parce qu’il le demande, mais parce qu’il en a besoin*] which roughly means, “Do not agree to his wishes because he asks for it, but because he needs it”, noting that Rousseau does not define who identifies those needs. Roaf and Bines (1989) pointed out that *needs* is often used when discussing development and learning for all children, but can be seen as being linked to social and cultural structures and issues of equality. They suggest this is evident in the haphazard and unequal provision that can be associated with attempts to deliver both general and special equitable educational opportunity. They suggest too that by linking “needs” with “special,” the focus has been shifted onto “*individuals as a bottomless pit of problems to be overcome or filled up*” (p. 10). They point out that the potential radicalism of associating needs with the context has been avoided, that their association with special means they are based upon deficits in the person; as such combining special and needs simply relabelled old problems and old practices.

This tendency to focus upon a deficit type of need, is perhaps not surprising given the use of the term special needs when it began to appear in educational texts. Gulliford (1971) for example, explained that people with different “*handicaps*” can have very similar special needs. He said we should not define individuals according to an impairment which results in loss of capacity or function but instead should focus upon the extent to which the impairment “*becomes a handicap*.” As an example he suggests that a “*child with low level of intelligence can be unhappily handicapped in a school with predominantly bright children*” (p. 5). The extent to which the impairment becomes a handicap “*depends on many other factors*” (p. 4) He suggests these are school factors, home factors, remedial intervention and the child’s intelligence, personality, number of impairments and the way he is developing. And the resulting needs “*may be met in a special school, in special classes or units in ordinary schools or be the subject of some extra attention and care within the ordinary work of schools*” (p. 6).

What Gulliford does not mention in his deficit view of special and needs, but Tomlinson does, are the professional vested interests which are associated with the remedial interventions offered by those services and that special “*expertise*.” Tomlinson predicted an ongoing expansion of these services with “*more expert special teachers, support staff, advisers and inspectors to be employed*” (Tomlinson, 1982, p. 161) suggesting this was an inevitable response to a range of educational and socio-economic pressures and priorities. Returning to this topic 30 years later (Tomlinson, 2012), she noted that whole new professions had emerged as part of this SEN industry, as well as numerous Associations, Institutes and certifying bodies. The huge growth in numbers of identified children, identifying professionals and in funding, across nations, leaves little room to doubt that special needs education has been on the up globally for decades (Rix, 2015).

Un-together?

Just because special and needs is a global growth business does not mean it is a unified field. In carrying out a review of special educational provision across 55 administrations in 50 countries (Rix et al., 2013) we noted that the only factors that applied across all administrations and countries were that:

- Children are marginalized within all education systems. (Who they are and why they are marginalized varies between systems.)
- Provision referred to as special involves time and space additional to that provided typically.

This variability means, for example, that countries' definitions of special educational needs cannot be categorized for comparison without creating a deceptive sense of commonality (Riddell et al., 2006) and consequently can only be listed as a tool for reflection (see OECD, 2012). In our study, the number of categories associated with special and needs varied considerably between countries; ranging from 3 categories to 22 categories. Once all the obvious similarities were grouped together there were 60 different categories which emerged across the 55 administrations. This of course reflects the relational nature of special and needs discussed above.

Special and needs are localized phenomena, responsive to localized priorities, policies, practices and understandings. For example, in England in 2016, 39% of people taking national exams at 15/16 years of age had been identified with SEN at some point in their school career, but the overall probability for this attribution was 71% explained by which school the child attended (Hutchinson, 2021). In 2020, in one English local authority, you could find that 3.4% of diagnosed children had been diagnosed with an autistic spectrum disorder, but in another local authority it was 25%. In every one of the 12 reported categories covering sensory, intellectual, functional and behavioral difficulties or impairment there were huge discrepancies. If you take the top 10 and bottom 10 English local authorities (to iron out the extremes) using any label, you will be more than 4 times as likely to have a particular diagnosis in a top-ten using authority than in a bottom-ten. This even applies for what might seem like a highly evident sensory-related category such as a hearing impairment. The only exceptions where the ratio falls slightly below 3:1 are around issues of behavior and communication which are usually identified by the teacher (DfE, 2020).

This is not just an English problem, of course. Special and needs is chaotic globally. Our administrative system may yearn for unification, but the reality is that our systems cannot provide this (Rix, 2020). For example, in the 50 country study mentioned above we visited Italy and Norway. Before we went we knew that both countries claimed to have closed their special schools, that Italy required a psycho-medical assessment to achieve additional funding while Norway did not. But when we got there we found that there were special schools and special classes in existence with varying degrees of official support at different levels within the system. In addition, some administrations in Italy were trying to provide additional funding without psycho-medical assessment, while in Norway psycho-medical labels were in everyday use as part of local funding distribution processes.

Assessments are clearly one of the major challenges for the seekers of certainty. Identifying and applying special and needs requires finding observable phenomena as evidence of behaviors or characteristics. The markers that experts search for have been selected as a focus because of their practical value in the diagnostic process. But consequently they can also be seen as theoretical constructs in their own right, requiring us to unpack *"the constructs underlying [the] symptoms"* (Wilshire and Clack, 2021) and creating considerable space for disagreement.

These theoretical and practical tensions underpin calls such as that coming from the Society for Humanistic Psychology, Division 32 of the American Psychological Association, regarding the reform and revision of diagnostic systems. In an official statement, released in February 2020, they talked about the need to move beyond the limits of individual diagnosis, to document and address the social and structural determinants at the root of difficulties. They concluded that the impact of these social and structural determinants was already supported by robust scientific evidence while the search for in-person factors continues to "elude scientists" who merely hold onto hope for *"the next taxonomic revolution."* A few years earlier, the British Psychological Society's Division of Clinical Psychology (BPS-DCP, 2013) had also called for *"a paradigm shift in relation to functional psychiatric diagnoses."* It said they: *"provide a flawed basis for evidence-based practice, research, intervention guidelines and the various administrative and non-clinical uses of diagnosis."*

This struggle to find reliable observable phenomena, goes across key categories associated with special and needs too; as well as being recognized across the field of educational psychology. For example:

- Elliott and Gibbs (2008) note that *"there is no clear discontinuity that provides an absolute categorical boundary for a diagnostic category of 'dyslexics'"* (p. 476);
- Norwich et al. (2014) note the paucity of research and the application in practice of Moderate Learning Difficulties which *"call into question"* (p. 17) its use as a category;
- Timimi (2021), citing other leaders in autism research, recommends disbanding Autism Spectrum Disorder entirely because of *"consistently inconsistent findings"* (p. 19) and decades of research bedeviled by *"replicability crises."*

Re-arranged?

Evidently a great many experts in the field of special and needs don't agree with each other about what to do, but there is fair agreement about what they/we disagree over. Norwich (2016) suggests that future assessment approaches need to: be underpinned and strongly informed by values associated with human rights; explore all functional aspects not just areas of concern; assume

interaction between impairments and the environment; and consider personal characteristics beyond the functional difficulties. Some people feel that achieving this is akin to squaring a circle, but this has not stopped people from trying. For example, as part of the global effort to come up with solutions, researchers associated with the British and American Psychological Associations have been exploring holistic solutions which take all the issue of context into account.

There are also other approaches to assessment that have been advocated at scale with the intention of transforming practice. Let's consider two important developments:

- Response to Intervention (RTI) arose in the United States with the growth (from the 1960s onwards) of concerns related to: discrepancies between “ability” and achievement; overidentification of learning disabilities; and a lack of both early identification and curriculum-based measurement. These combined with the emergence of influential research groups and policy makers and led (in 2004) to the RTI's place in the Individuals with Disabilities Education Act (Preston et al., 2016). There are two dominant RTI approaches, operating in stages either as a problem-solving approach focused on individual students, or as a standard protocol that operates at class, small group & individual levels. A strong motivation in RTI is the application of evidence-based practice.
- The international classification of functioning, disability and health (ICF) was approved by the World Health Organization in 2001. The ICF is based on a biopsychosocial model, in which functioning and disability are understood as complex interactions between biological, psychological, and social factors. A central problem within the educational context is the ICF's breadth, and so firstly an ICF-CY was produced with a focus on childhood and youth, and then in 2011a, Hollenweger designed an eligibility procedure for specialized education services based on the ICF-CY and the United Nations Convention on the Rights of Persons with Disability. Her intention was to build bridges between the child's situation and the teacher's situation, creating opportunities for reflection and co-ordinating support (Hollenweger, 2014).

The intentions behind both of these developments can seem admirable. They are based upon critical engagement with dominant deficit views of special and needs. Both seek to work within the learning context and focus upon functional involvement to transform teacher practice and the learner experience. However, for both these models (and I would suggest from any frameworks likely to emerge from the work of US & UK psychologists), there seems to be a more fundamental problem. They are facing a tri-partite problem. The challenge of engaging with function in context is only one part. The other two are:

- The people who are undertaking the assessments and delivering the learning support; and
- The funneling of attention back onto the individual.

These two issues are interwoven. Focusing personalized, responsive attention onto the individual sounds like it should be great, but it brings practitioners (and researchers) back to individualized notions of need. They are still seeking to identify certain learners as inherently different, and therefore for many practitioners this equates to a child who requires inherently different teaching. The special and the needs are still there. This seems to be borne out by studies of teachers engaging with these approaches. It is clear that school personnel (including administrators, psychologists, and teachers) are unclear about the purpose of RTI and their roles within its application (Cavendish et al., 2016); it has also been shown to create discomfort and chaotic dynamics and to be dependent upon the contexts in which it is delivered (Dulaney, 2013). It is hardly surprising therefore that practitioners feel that to engage with RTI they need professional development (Newman Thomas et al., 2020).

The call for greater professional development has been at the heart of special and needs from the earliest days (a key part of the professionalization process about which Tomlinson spoke). As with RTI, where the ICF has been introduced in an educational context, teachers are frequently resistant to making use of it. Hollenweger (2011b) herself writes about the need for specific training to engage with her approach. Studies often link teacher resistance back to the need for training, highlighting how the intensity of training makes teachers more likely to see it as a useful approach, and calling for the introduction of ongoing professional development and a process of reflective practice to ensure they engage with its processes (e.g., Saragoça et al., 2013). In RTI, this need for skills training and knowledge acquisition is intensified not only by advocating for the use of an evidence base, but also because the teacher has to work with increasing specialization with the child as they move through the tiers, toward increasingly individualized support (Fuchs and Fuchs, 2006). A similar knowledge-gap dilemma emerges from the ICF-CY-Rights model. Hollenweger describes three types of information that should be sought, two of which can be gathered “objectively” by specialists, with only the third involving teachers, where their views are sought about contextual factors (e.g., resource availability, cultural values, treatment priorities, expectations).

This call for training also runs up against another challenge for special and needs, the research base within which any expertise is situated. Whenever systematic literature reviews consider educational research associated with any special and needs intervention and/or category of impairment they conclude that there is a paucity of evidence, that the research is either not at a suitable scale or of a suitable quality to make hard and fast conclusions (Rix, 2015). The problem for evidence seekers is that any intervention needs to be fully tested in real world contexts (Holman et al., 2018). Its own measure of effectiveness, and therefore proof of truth, can only be satisfactorily proven when it is reliably producing its predicted outcomes within those everyday classroom contexts, in a wide variety of cultures undertaken by everyday practitioners. The complexity of such an approach might seem beyond the means of many researchers who are not suitably networked, particularly since agreed evaluation processes at scale still need to be developed (Stahmer et al., 2018) and the resources and costs are considerable (Horner et al., 2017). However,

even for those who are well networked such an approach can prove hard to achieve simply because of the practicalities of achieving a realistic sample (e.g., [Taylor et al., 2017](#)). This difficulty is made harder by the challenges of delivering evidence-based practices with “fidelity” to the original designers’ intentions. The lack of fidelity would seem to be evident for example in relation to RTI studies that suggest the process of identification is still arbitrary ([Hendricks and Fuchs, 2020](#)) and still overestimates the focus population ([Kranzler et al., 2020](#)).

Continuation?

Both the RTI & ICF-CY-Rights approaches require external specialists to oversee them and/or interested colleagues who are willing to develop the skills valued by those experts. They both run up against the same barriers that so many ideas (not just dealing with special and needs) face when they are introduced into schools. They are primarily non-educational constructs which have been redesigned to fit into the education world. The response of teacher’s therefore is that they require to be trained in “it.” “It” is not something which they can do as part of the day job. “It” requires a special expertise. Secondly, the whole process echoes the continuum model which was described in the 1960s and 1970s, and so can neatly fit within the thinking associated with it. The continuum mindset nestles up to the notion that the teacher does not have the necessary knowledge. Children and young people are positioned on a continuum of need, supported within a continuum of provision, and by a continuum of services. The priority of policy makers is to provide what they regard as the institutional flexibility associated with a continuum of settings and services. The expectation for teachers is that someone else can offer support if they do not ([Rix et al., 2015](#)).

Yet, the continuum did not emerge as some brilliant invention seeking to deliver social justice. It merely represented the provision and resources available as education began to accept people who had been previously ignored by schools or had been kept in long-stay institutions. It was (and is) an idealized solution for the challenge of how to organize, identify, place and teach special and needs. The use of the continuum metaphor was an attempt to provide a logical framework for the chaotic nature of the available provision. It was part of the great search for certainty at the heart of our educational process and of special and needs ([Rix, 2020](#)). Perhaps ironically, the development of special education and psychology also had their birth in this search for certainty, emerging from processes developed for selection and intervention, such as the measurement of behavior ([Clough, 1995](#)), grace ([Goodey, 2011](#)) and the acceptable range of a child’s performance at school ([Richardson and Powell, 2011](#)).

This continuation of the old ways of doing things, under the guise of doing something new, is a symptom of this search for certainty in the face of a complex, uncertain world. People are reassured if they can feel that their responses are “correct.” They highly value the processes and the outputs of the systems of which they are part, they recognize how the structures organize the distribution of resources, and how they enable their evaluation and their effectiveness across the system. However, the fundamental challenge is that seeking certainty oversimplifies the complexity to make it manageable; in creating boundaries it not only restricts the problem to an individual or small population of individuals, it means that shared or less obvious difficulties are missed. This is not to say that people within systems seeking certainty are not aware of the problems that can be created by those systems. The problems are frequently evident on a large scale. However, the institutional and policy context limits their capacity to think outside and beyond those institutions’ and policies’ boundaries, constraining their responses ([Ball, 1994](#)). As a result, our responses continue to divert focus away from the wider impact and structures of schools, from the complex economic and social factors underpinning disablement and from the delivery of meaningful social reform ([Slee, 2008](#)).

Beyond?

So what can be beyond special and needs? It is very difficult to see how we can move past its structures and mindsets when they are so deeply embedded in our current educational system. As much as we may wish our education systems to be transformational, there is a long tradition of powerful voices who see them as the necessary means of creating certainties, enabling social control and social organization. Attempts to meaningfully change any of these systems by arguments around rights and social justice is at best only going to deliver a few compromises and some pockets of success. This support for the status quo is a real problem for moving beyond special and needs, when many experts advocating change can be seen as saying—to mis-quote an old Irish saying—“*you don’t want to start from here, you need to start from over there.*”

So how can we start from here yet still generate movement away from special and needs. My solutions are premised upon encouraging a greater acceptance of the uncertainty at the heart of our life experiences, but they begin with recognizing and being responsive to the demands of the marketplace. Whenever business leaders are asked about what it is that their companies need, the newspaper headlines always focus on literacy and numeracy, alongside STEM and language communications. These are no means the top priorities though. Businesses are always looking for a focus upon interpersonal and intercultural competencies as well as methods of assessment to evidence these skills. They are concerned with life experience and attitudes, team working skills, communication skills, business and customer awareness, customer handling skills, foreign language skills and international cultural awareness ([Rix, 2015](#)).

If we want to meet these market demands we need to be arguing for (and getting businesses to be advocating for) pedagogies that embrace uncertainty, rather than seek certainty. This pedagogy of uncertainty is closely allied to relational, socio-cultural views of learning and critical pedagogies, as well as much of the writing associated with inclusive education and 21st century skills. It would take very little to redesign our assessment system and curricula to reflect this, making it a platform for our social goals and meeting market needs. We can prioritize any learning of subjects and key skills in this context. They can be part of our how we explore and validate people's capacity to consider ideas and resolve challenges interdependently in social contexts in ways that are meaningful to those involved (Rix, 2020).

Perhaps more challenging, but closely allied to this advocacy for engaging with a pedagogy of uncertainty, is shifting classroom practice away for constructivist to socio-cultural models of learning. This shouldn't be impossible though. This is the model taught in a great many teacher training contexts already. It can be seen to be encouraging teachers to adapt the principles of good teaching. These principles are widely regarded as being active, highly skilled and providing rich opportunities for learners within a well-planned and organized setting.

Effective practice relies upon everyday classroom ways of working: ways which teachers can readily understand, particularly if it fits with the curriculum and assessment required of them. Where there is an evidence base, it seems to be encouraging teachers to:

- Recognize their responsibility for all pupils, having respect for them and for all learning, while seeing everyone as a learner and collaborating with teachers who share this model of learning;
- Recognize social interaction as the means to develop knowledge as well as having clear learning goals and subject skills and knowledge;
- Plan to scaffold both cognitive and social content, delineating group roles, and using pupils own understandings as resources for learning;
- Explore pupils' understandings, encouraging questioning, making links between areas of student knowledge;
- Offer multimodal opportunities, with a focus upon the representation of concepts and the links between them, making them relevant and authentic;
- Focus upon communicative behaviors, and encourage naturalistic, child-centered and child-led approaches;
- Encourage playfulness and problem-solving, involving co-constructing, collaboration and setting aside time for learners to explore resources and generate ideas; and
- Explore real-world, practical, open-ended problems while providing direction, boundaries and support (Rix, 2021).

Importantly for a discussion of special and needs the approach outlined above removes special from the equation. If you are working in the manner described above to meet the needs of markets and reflect mainstream pedagogic guidance, then what might be considered an additional space or time becomes part of the everyday space and time. It is part of the day job.

This does not resolve the needs issue though.

Needless?

Needs is where the practitioner hits a wall. *The child(ren) who cannot do what the others are doing*. This is where teachers seek the support. This is where the assessment begins and this is where the big loop back to individualism restarts and special is reborn. If we wish to deal with needs we have to face three challenges: how we label them; how we identify them; and how we fund their support. As soon as any of those three factors becomes additional then the needs become special again. In order to deal with this—in a place which is very close to here—we have to embrace both the principle of uncertainty and teacher-relevance.

So let us start with the labels. I am an advocate of labels of opportunity (Rix, 2007). What teachers need is something simple. Something manageable. Something which makes them feel capable. They want something that does not make them call for more training from the outset. If we have to provide a label, school staff need one that encourages them to think about how they can best work with a child—that would support teaching, learning and social interaction. Consider, for example, the label of autism. This may be useful in a medical context and as a matter of pride, but within an education/social care/everyday situation it fails to open up a huge range of possibilities: this could be a child who will go to university or one who will never engage in effective eye to eye contact; they may be able to run a marathon or struggle to attend any social gathering; they may have many friends or may have none. Even if a teacher knows all the characteristics associated with this label, the child they are teaching will only have some of those characteristics. They have to deal with the child as they are, *just like they would with anyone else*. Depending upon this child's circumstances and the resources available in the setting, they may be more usefully described as *"a person who benefits from support to build social relations"* or *"a person who will use the break out space."* Such a label would not cover everything, but it would be a start and would help both the person who used the label and the person it was applied to. They are far simpler to share, to comprehend and to hold yourself to account for. They can be locally relevant, easier to assess, and less prone to the postcode lottery. It is a label about how to do something. It is situated in the social, creating relational opportunities and provocations. They can also change in ways that reflect the priorities of the people they are describing and the people involved in their lives. For example, the first

label mentioned above (benefiting from support to build social relations) may only be required for a while, perhaps at the start of each academic year, and not once some relationships had been established. Labels of opportunity are not who you are forever. They are who you are at the moment.

A move away from needs would also be supported by linking our descriptions of people to their access preferences rather than deficits or functional comparisons. For example during a participatory research project (working with disabled people, technology companies and museum education departments across Europe) there was an early collective agreement to refer to us as having access preferences. These were what we chose to include in the demographic data. There were many categories identified by the participants, ranging from Blue badge parking to Sign Language, Induction loops to Magnifying glasses, One-to-one support to Gallery stools. Such categories were specific to the museum context in which they were collected, but they far more effectively enable people working in museums (and elsewhere) to consider possibilities and the solutions for visitors, rather than having to make presumptions based upon a generalized diagnostic label. As the participants were quick to point out, many of these access options would also have benefits across a range of users, not just a particular group to whom they might be typically supplied (Rix, 2021). By focusing upon labels of opportunity and access preferences, teachers would be better prepared to envision practice. This is not to suggest that such labels would not also bring with them social and cultural assumptions, which could create problems with the people to whom they were applied. But they would be more likely to create commonalities around how access was supported. They would be more likely to enable a focus upon relationships and the support mechanisms between people.

The next creator of needs is our paperwork (Rix and Matthews, 2014). Beyond its perpetuation and construction of needs, our current paper work has three further practical problems. The first is the amount of it; the second is how it drives our ways of engaging; the third is how it removes highly knowledgeable individuals from the space in which they have most to contribute, the class learning context. Our goal has to be to reduce paperwork without reducing responsibility. The solution is to move away from the individual plans; and instead to encapsulate the rich knowledge that emerges in discussions about collective teaching and learning situations in which diverse individuals are situated. The paperwork that evidences and plans for this would therefore be a record of discussion about current priorities in a class situation. It would more closely resemble a set of minutes from a committee meeting, reflecting topics of discussion with action points. The key would be what is on the agenda. The possible questions might be as varied as the contexts which need to be drawn upon, but the discussion would recognize that people can only develop as part of a developing context which itself develops as the people do. So, for example, whatever issue was identified for a child or group of children (e.g., how to take advantage of some labels of opportunity or how we ensure we are responding to access preferences, or enabling collaboration, or exploring a topic of study), the discussion would need to consider all aspects of the community of provision, the space, support, staffing, students, strategies and systems (Rix et al., 2015). This would include availability of resources at all levels of the system, as well personal and professional experiences across the setting; what people feel they cannot do, as well as what they might be able to do, and why. Such an approach also lends itself to more regular discussions. It is not required once a year; it is not about singular children; it does not take place after numerous reports are written. It can happen once a week. Process can still be recorded. Responsibility can be allotted. But the paperwork can respond to the shifting reality of the uncertain classroom.

This more open use of paperwork, focused far more upon the context in which learning is taking place of itself can also be used to inform teacher-friendly funding and support decisions. It would not take much to shift to a class based funding model (Rix, 2009). This model would not be a conglomeration of individual assessments, each with a score that can be totted up to produce a banding total. This funding evaluation would begin with the collective context. It would identify not only the individuals and their access preferences, but also the support that was available and what was required to deliver collectively agreed goals for the whole class. It would still acknowledge the individual, but it would place them in the collective context of the other individuals around them, taking into account the skills and experiences of not just the pupils but the adults working alongside them. It could encourage possible learning opportunities when people are together. A class model could be flexible, with long term and short term budgetary processes. It would have local direction, but could still be controlled by traditional mechanisms of governance. Importantly for the established professions, allying class based funding models to collectively focused paper work would not remove expertise from the frame. It is not about saying that there is no place for speech and language therapists or educational psychologists and so forth, but it reduces the need for them to be churning out the paperwork, to be making final decisions and allows them to be part of a team, critical friends and/or active participants. It respects that they have wisdom to contribute to the benefit of all.

And?

If we wish to move beyond special and needs, we need to focus upon good teaching, authentic curricula, and interdependent assessments using labels of opportunity which recognize people's access preferences, and are supported by collectively focused paperwork along with class-based funding models. In doing this we can respond to market needs, build on the skills and experiences that practitioners have, reduce paperwork, allow experts to contribute directly to practice and provide robust mechanisms for governance and funding. If we wish to move beyond special and needs, we do not have to deny ourselves the security of certainty, but we should recognize it as a brief moment that will pass back into the uncertainty from which it came.

As the poet (me) said at the start of this all “*I have a problem.*” Well, it’s not just his (my) problem. We only have special and needs because we are determined to make things harder for ourselves.

However
In a world of uncertainty
we can rely upon
a different knowing
that all needs
are
our needs
not special.

Introduction

In 2022, state education systems around the world should be making good progress to implementing inclusive education, in theory and practice, with Sustainable Development Goal No. 4 (2015 (17 goals agreed)) and Article 24 of the United Nations Convention on the Rights of Persons with Disabilities (2006) committing country leaders to developing an inclusive education system.

Historically, mass state education in the developed world grew to meet the requirements for a literate and then increasingly technological workforce. The more progressive and liberal reformers viewed education as a Human Right, a means of overcoming age-old traditions and for coming generations to have the means for less oppressive and more fulfilled lives. Foremost among these excluded groups are women and girls, ethnic and linguistic minorities and disabled people. The last was seen as the most difficult to address. Education for Blind and Deaf children was first to be addressed, then those with physical impairments and lastly those with intellectual impairments and psycho-social and neuro-diverse conditions such as autism. Education for these groups was seen as a good idea. Students either had to “pass” as non-disabled and manage the environment, curriculum and social relationships on non-disabled people’s terms (integration); or their needs were seen as too disruptive to the education of non-disabled children and they were placed on a medicalized path of special education leading in most cases to segregated special schools (segregation). The dual education system that emerged over time was expensive. It required two sets of buildings, two sets of staff and two types of curricula. The accounts of survivors of the segregated system overwhelmingly talk of the negative impact on their self-esteem and lack of useful social skills to live and work in the world, and in most cases of the very low educational expectations.

The adoption of the Universal Declaration of Human Rights, 1948 (including the right to education: Article 26), the setting up of the United Nations, and the decolonization of territories leading to many new countries has led to contradictions in education systems set up in these developing countries. Most new countries replicated the dual mainstream/segregated system in developed countries or more likely excluded disabled children from education or allowed casual integration leading to a situation where large numbers of disabled children do not access state education or where they drop out in the early grades.

In carrying out a review of the state of education systems across the 54 countries of the Commonwealth with regard to implementing Inclusive education, as outlined in Article 24 of the UNCPRD (2006), the author found that even in countries such as India, Bangladesh, Pakistan, Nigeria or South Africa, where policies existed for including disabled children in education, examples of good practice were rare and usually due to small scale, Non-Government Organizations (Northern) projects (Rieser, 2008/2012). Fundamentally it was a lack of political will backed by lack of funding and traditional and old-fashioned ideas about disabled children and their capabilities.

The Covid-19 Pandemic is very likely to have a long-term impact on the education of disabled children as they were particularly affected by lockdown, impacting on support arrangements, difficulties with accessing on-line learning, getting out of the habit of schooling and so not returning to class. *Then There Was Silence* (Lunt, 2021) demonstrated in a UK-wide survey over the first 18 months of Covid: children and families have been isolated and abandoned and not been listened to. Covid restrictions meant services were stopped or reduced, and many are still slow to return. Mental health and wellbeing of all the family has deteriorated, children’s conditions have worsened and their needs have become more complex; delays in assessments mean needs haven’t been identified. A World Bank (World Bank, 2021) study showed that in the Spring of 2020, at the peak of the pandemic, 180 countries experienced temporary school closures, affecting 1.5 billion young people or 94% of the student population worldwide. For more than half of these students, schools would remain closed for more than seven months. A year after the worldwide spread of COVID-19, in March 2021, schools remained closed in more than 50 countries. Governments tried to respond to these unprecedented times

by employing remote learning initiatives using both digital and nondigital formats. However, inadequate infrastructure or the absence of trained teachers who could quickly transition to online models of teaching often limited the effectiveness of such responses especially for disabled children. Disabled children have been slower to return to school with many dropping out.

The Global Crisis in 2008 has reduced funding for state education, both in real terms within states and in terms of transfer of aid from richer to poorer countries. The ideology of Neo-Liberalism has reinforced this pattern of concentration of wealth among the very rich. The gap between the rest of the population widening, part of which has been the systematic, real terms reduction of egalitarian services like state education where they exist and a reduction in international state aid to those areas where they do not exist. The National Audit Office (July 2021) looking at school funding in England found that:

Although the Department's total funding for schools increased by 7.1% in real terms between 2014–15 and 2020–21, the growth in pupil numbers meant real-terms funding per pupil rose by 0.4% (Paragraph 7) ...

In recent years, there has been a relative re-distribution of funding from the most deprived schools to the least deprived schools (Paragraph 16).
National Audit Office (2021).

People on the other hand are not just pawns in an economic and ideological system and their love for their families and fellow humans can, against the odds, lead to developments with glimpses of an inclusive and an egalitarian future which many do/would materially and ethically benefit from. In this chapter I will explore how these contradictions impact on the development of inclusive education for disabled people in England and globally from the point of view of a disabled pedagogue and inclusion advocate.

Disabled people, rather than **persons with disabilities** will be used throughout this chapter as the oppression of **disabilism** is rooted in traditional, overwhelmingly negative myths, reinforced by the development, over the last 300 years of the **medical or individual view of disabled people**. In this view, a disabled person's medical condition was thought to be the root cause of their exclusion from society, an approach now referred to as the **medical or individual model** of disability. Using the thinking of the Disabled People's Movement, where the **social model of disability** identifies the barriers of environment, attitude and organization which disable people with impairments and lead to prejudice and discrimination. Our impairments can be physical, metabolic, sensory, intellectual, mental or psycho-social, but we view ourselves as united by a common oppression and so are proud to identify as **disabled people** rather than **people with disabilities**. To call ourselves "persons with disabilities" is to accept that we are objects and powerless. This is logical but very much a minority view, since the United Nations adopted a Convention on the Rights of Persons with Disabilities UNCRPD, in 2006.

Bringing the paradigm shift into education of disabled children and students

The UNCRPD (2006) does address a paradigm shift from charity and medical views toward a human rights approach to disability and disability rights.

Persons with disabilities as subjects of **rights**, not objects of charity

The Convention takes to a new height the movement from the treatment of persons with disabilities as "objects" of charity, medical treatment and social protection towards viewing persons with disabilities as "subjects" with rights who are capable of claiming those rights and making decisions for their lives based on their free and informed consent as well as being active members of society. The Convention gives universal recognition to the dignity of persons with disabilities.

United Nations Enable UNDESA (2007).

The United Nations UNCRPD Committee is charged with overseeing the implementation of the UNCRPD (2006). It is elected by United Nations member states who have ratified the Convention, currently 184 (February 2022). It comprises 20 experts, mainly disabled people. In 2016 the Committee called a General Day of Discussion because they were finding that member countries reporting to them were not understanding what was required of them to implement Article 24 and an inclusive education system, but instead were continuing with a special education system, mainly relying on segregation in separate special schools. Within many poorer countries, the large majority of disabled children were not attending school. Following consultation with state parties and civil society organizations, the UNCRPD Committee issued a General Comment (No. 4) in 2016 clarifying what state parties were required to do to implement Article 24 of the UNCRPD (United Nations, 2016, CRPD/C/GC/4).

It is worth quoting at some length from the opening passages of General Comment (No.4) and providing illustrative historic exemplars to provide a context:

2. Recognition of inclusion as the key to achieving the right to education has strengthened over the past 30 years and is enshrined in the Convention on the Rights of Persons with Disabilities, the first legally binding instrument to contain a reference to the concept of quality inclusive education. Sustainable Development Goal 4 too affirms the value of inclusive, quality and equitable education. Inclusive education is central to achieving high-quality education for all learners, including those with disabilities, and for the development of inclusive, peaceful and fair societies. Furthermore, there is a powerful educational, social and economic case to be made ... Only inclusive education can provide both quality education and social development for persons with disabilities, and a guarantee of universality and non-discrimination in the right to education.

3. Despite the progress achieved, however, the Committee is concerned that profound challenges persist. Many millions of persons with disabilities continue to be denied the right to education and for many more education is available only in settings where persons with disabilities are isolated from their peers and where the education they receive is of an inferior quality.

The idea of barriers and dismantling them is now seen as an important component of delivering human rights for disabled people, both in education and in/with all socially constructed organizations, attitudes and environments. This is a relatively new idea which came out of the struggles of physically disabled people in the 1970s, to live independently and to challenge oppressive attitudes that viewed them through a medical model lens, confining many of them in care homes. Like all good social ideas, it happened in a number of places around the world at about the same time.

The Zimbabwean disability movement for equality was born in institutions run by Jairos Jiri in 1975, but he did not support it. Like many people at that time, he saw the call for involvement, participation and increased opportunities as a threat to his charity model. The movement emanated from disabled people, like Alexander Phiri and Joshua Malinga who went on to become a politician against white rule and Mayor of Bulawayo from 1993 to 1995. These activists formed and registered the National Council of Disabled Persons Zimbabwe which started as Kubatsirana Welfare Society and later National Council for the Welfare of Disabled, while still in the institutions.

Even from day one, I had an in-born attitude not to accept the attitudes at Jairos Jiri. These ideas were very bad; for example, disabled people were told when to eat, when to sleep, that we couldn't make love—it was banned! Clients do not have any say about how the services are provided or about which services they receive The services available to clients contribute to the under-development of disabled persons; but they help to contribute to the development and conscientisation of activists of the Disability Rights Movement.

Joshua Malinga.

In 1980, Malinga attended Disabled Peoples' International's Winnipeg World Congress in Canada. This marked internationalization of disability work in Zimbabwe and its spread across Southern Africa.

In the early 1970s, the Union of Physically Impaired Against Segregation (UPIAS) was formed around Paul Hunt, a disabled resident of a Leonard Cheshire Home. By 1974 they produced a policy statement with the following aim:

The Union aims to have all segregated facilities for physically impaired people replaced by arrangements for us to participate fully in society. These arrangements must include the necessary financial, medical, technical, educational and other help required from the State to enable us to gain the maximum possible independence in daily living activities, to achieve mobility, to undertake productive work, and to live where and how we choose with full control over our lives.

Union of the Physically.

UPIAS went on to be the catalyst for the formation of the British Council of Disabled People's Organizations (BCODP). Similar Movements can be identified in New York in 1973, in Malaysia, Sweden and elsewhere in this period.

This crystalized when 400 representatives of organizations led by disabled people walked out of the Rehabilitation International Conference in Winnipeg in 1980. They set about preparing for the inaugural conference of a new global organization to represent disabled people. In 1981, Disabled Peoples' International, at its founding World Summit in Malaysia, adopted the following statement:

Impairment is the loss or limitation of physical, mental or sensory function on a long-term or permanent basis.

Disability is the loss or limitation of opportunities to take part in the normal life of the community on an equal level with others due to physical and social barriers.

Disabled Peoples' International, 1981 (Barnes, 1991).

This definition is partly recognized in the United Nations Convention on the Rights of Persons with Disabilities (2006), pointing to the evolving nature of what is included, but clearly breaking with the old ‘medical model’ approach and focusing on interaction with barriers.

Persons with disabilities include those who have long-term physical, mental, intellectual or sensory impairments which in interaction with various barriers may hinder their full and effective participation in society on an equal basis with others.

UN (2006).

To understand this transformation referred to above we need to be complexly clear about the impacts of these two approaches. See **Figs. 1A, B and 2** below.

The first Figure (A) is based on a “medical model” approach with the focus on fixing the person. However, many impairments are for life and so not fixable. This is not to say that disabled people do not need the best rehabilitation and medical support, but we do not need this to be the primary focus, which needs to be on changing the structures in society and the barriers they create. Figure (B) holds out a way forward which is not about primarily changing us as disabled people, but dismantling the socially created barriers as part of our Human Rights.

Myself and Micheline Mason developed an analysis of applying this transformation to schools in 1990 ([Rieser and Mason, 1990](#)) in *Disability Equality in the Classroom* for the Inner London Education Authority and then in *Altogether Better* in 1994 ([Mason and Rieser, 1994](#)), a training pack for Comic Relief to develop Inclusion in Education.

In 2008, when writing the Commonwealth Book, these ideas were further adapted and then presented to the Global Summit on Disability in 2018.

Fig. 3 examines the different geographic expression of thinking about disabled children and educational provision.

Exclusion is the majority state for disabled children in the South and Segregation is the majority in the North.

Building on the above analysis, General Comment No 4 makes clear the key parts of a definition of inclusive education and different organizational forms of education for disabled children **exclusion, segregation, integration and inclusion** and that only inclusion can meet disabled children’s Human Rights.

11. The Committee highlights the importance of recognizing the differences between exclusion, segregation, integration and inclusion. **Exclusion** occurs when students are directly or indirectly prevented from or denied access to education in any form. **Segregation** occurs when the education of students with disabilities is provided in separate environments designed or used to respond to a particular impairment or to various impairments, in isolation from students without disabilities. **Integration** is the process of placing persons with disabilities in existing mainstream educational institutions with the understanding that they can adjust to the standardized requirements of such institutions. **Inclusion** involves a process of systemic reform embodying changes and modifications in content, teaching methods, approaches, structures and strategies in education to overcome barriers with a vision serving to provide all students of the relevant age range with an equitable and participatory learning experience and the environment that best corresponds to their requirements and preferences. Placing students with disabilities within mainstream classes without accompanying structural changes to, for example, organization, curriculum and teaching and learning strategies, does not constitute inclusion. Furthermore, integration does not automatically guarantee the transition from segregation to inclusion.

Paragraph 11, General Comment No. 4.

In developing countries with low or middle income, planners and politicians should try **not** to set up a continuum of provision, but try to provide support and services to the school by use of itinerant specialist teachers and local district support centers. In terms of restructuring the provision of education especially in more developed countries this means moving from a continuum of provision approach to one where a constellation of services is around the student and their teacher in the regular or mainstream school, depending on the level of economic development. See **Fig. 4**.

Fig. 1 (A) Disabled people as passive receivers of services aimed at cure or management. (B) Disabled people as active fighters for equality working in partnership with allies. From [Rieser \(2004\)](#).

Medical model thinking	Social model thinking
Child is faulty	Child is valued
Diagnosis	Strengths and needs defined by self and others
Labelling	Identify barriers and develop solutions
Impairment becomes focus of attention	Outcome-based programme designed
Assessment, monitoring, programmes of therapy imposed	Resources are made available to ordinary services
Segregation and alternative services	Training for parents and professionals
Ordinary needs put on hold	Relationships nurtured
Re-entry if normal enough OR permanent exclusion	Diversity welcomed, child is included
Society remains unchanged	Society evolves

Fig. 2 The two routes identified start from basic values and underline that the denial of disabled children's human rights starts with a lack of viewing us as human. Adapted from [Mason and Rieser \(1994\)](#).

Fig. 3 Form of organization of education for children with disabilities ([Rieser, 2018](#)).

Barriers to inclusive education and ways to address them

If barriers and removing them is the key to Inclusive Education, what are the key barriers that obstruct the development of Inclusive Education? General Comment No. 4 identifies them, pointing out they can be attributed to multiple factors, that include:

- The failure to understand or implement the human rights model of disability, according to which barriers within the community and society, rather than personal impairments, exclude persons with disabilities;
- Persistent discrimination against persons with disabilities, compounded by the isolation of those still living in long-term residential institutions, and low expectations about those in mainstream settings, allowing prejudices and fear to escalate and remain unchallenged;
- Lack of knowledge about the nature and advantages of inclusive and quality education and diversity, including regarding competitiveness, in learning for all; lack of outreach to all parents; and lack of appropriate responses to support requirements, leading to misplaced fears and stereotypes that inclusion will cause a deterioration in the quality of education or otherwise have a negative impact on others;
- Lack of disaggregated data and research (both of which are necessary for accountability and program development), which impedes the development of effective policies and interventions to promote inclusive and quality education;
- Lack of political will, technical knowledge and capacity in implementing the right to inclusive education, including insufficient education of all teaching staff;
- Inappropriate and inadequate funding mechanisms to provide incentives and reasonable accommodations for the inclusion of students with disabilities, inter-ministerial coordination, support and sustainability

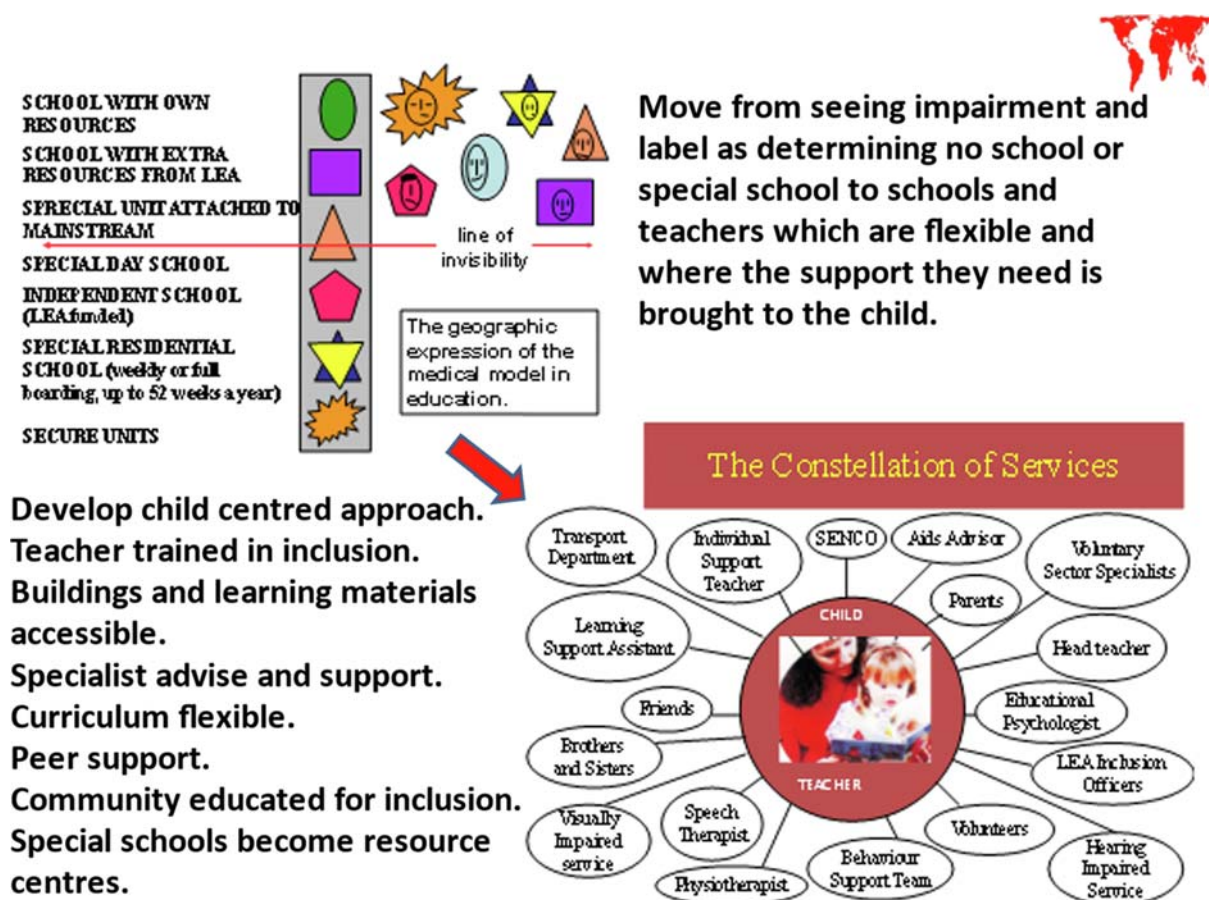

Fig. 4 The continuum of provision.

(g) Lack of legal remedies and mechanisms to claim redress for violations (Paragraph 4, General Comment No. 4, 2016)

One of the big barriers that has obstructed real moves to Inclusive Education are normative testing and outcome tables, such as Organization for Economic Cooperation and Development, (OECD's) PISA tests of 15-year-olds which are very often picked up by politicians as a false measure of how competitive their school system and therefore economy is likely to be. PISA is the OECD's Program for International Student Assessment. PISA measures 15-year-olds' ability to use their reading, mathematics, science knowledge and skills to meet real-life challenges and is run every three years (OECD). As a UK Coalition Government White Paper (2010) makes clear:

So much of the education debate in this country is backward looking: have standards fallen? Have exams got easier? These debates will continue, but *what really matters* is how we're doing compared with our international competitors. That is what will define our economic growth and our country's future. The truth is, at the moment we are standing still while others race past.

DfE (2010).

While efforts have been made to be more inclusive in PISA tests, as many students with SEND are excluded as included, with a particularly high number excluded with cognitive or intellectual impairment or using sign language as their medium of instruction. In addition, many small schools are excluded which will include special schools. In the UK in 2008 all special schools and Pupil Referral Unit students were excluded from sampling for the test cohort (Smith and Douglas, 2014). A more recent investigation by the European Network for Independent Living (Efthymiou, 2021) found that the PISA test stands for Exclusion not Inclusion. For example, students will be "included when their needs are not serious enough to be a barrier to their participation."

PISA also does not encourage schools to provide accommodations to students with access needs to participate in the test. This is made clear in the 2020 PISA project manual (PISA, 2020), which states that the test can only allow "... limited modifications and accommodations to assist students with special educational needs". By reinforcing the stereotype that only some disabled people can be educated, the PISA test reinforces the idea that it is "natural and expected" for disabled students and others with support needs to be excluded from the society.

The Exam Factory (NUT, 2015) system created in England by the UK Government over the last 12 years based on high stakes testing, a narrowing of the curriculum, more testing of knowledge, a reduction in methods of testing, increasing the status of exams, downgrading or stopping continuous assessment, course work and folders of work have all made it far more difficult for a range of disabled students to demonstrate what they can achieve.

Results in England from public exams show that despite a range of reforms to KS4, the gap between disabled and non-disabled students remains high and is widening. The attainment difference between pupils with SEN compared to pupils with no identified SEN remains the largest difference of all characteristic groups. Pupils with SEN perform markedly worse than pupils with no identified SEN across all headline measures of attainment. The attainment differences remained broadly similar to 2018, however there was a slight widening in the difference in EBacc entry between groups (0.7% points) with 13.5% of pupils with SEN entering EBacc in 2019, up from 12.4% in 2018 (assets).

New attainment indicators were introduced in 2014/15 at Key Stage 4—Attainment 8 and Progress 8. The average attainment 8 score for pupils with SEN in 2019/20 was 30.7 compared to 53.7 for those with no SEN. The average attainment 8 score for pupils with SEN support was 36.4 and for pupils with an EHC plan was 15.2 (educational).

Another barrier is attitudinal and particularly parental attitudes to the education of their disabled children. In England the factors identified above together with an ideological position of the Conservative Party who have been in power for the last 12 years. David Cameron, former Prime Minister, who had a disabled son and was strongly against him being included, promoted a policy of being “against the bias toward inclusion.” The failure to promote Inclusive Education linked with the narrowing of curriculum opportunities and two other factors, has led to an unprecedented number of disabled children being out of mainstream school with increasing segregation. Firstly, the Academies program taking schools away from Local Authority or Municipal control, which are handed over to be run increasingly by Multi Academy Trusts. These schools have no democratic control by the local community and parents, do not have to employ trained teachers (other than the Special Educational Needs Co-ordinator), have their budgets top sliced from the Local Authority’s and are provided directly by Government. In addition, Local Authorities are unable to build any new community schools, only Academies to meet need.

The Government is putting their faith in Academies to bring about improvement. But we know from work by Brahm Norwich and his colleagues at Exeter (Lin et al., 2020), analyzing the National Pupil data base, that, in the last 10 years, those schools that have become Academies, especially converters—those schools that are usually rated outstanding by OFSTED that have chosen to be academies, have reduced the numbers of students identified with SEN at a faster rate than the community schools. This has partly led to the big acceleration of numbers in special schools.

Secondly, despite increases, in real terms school budgets have reduced as the numbers of students has increased. This has hit SEND budgets particularly hard as these are not ring-fenced and many of the essential support staff who make inclusion work have been made redundant. Schools in England have delegated budgets and are responsible for hiring and firing staff under Local Management of Schools, which was introduced in 1988. The National Education Union who represents the largest group of teachers and those who work in schools commented on a recent White Paper on Leveling Up, “While the National Education Union welcomes any new investment in schools” it is vital to note, as the National Audit Office (National Audit Office, 2021) has pointed out, “there has been a relative re-distribution of funding from the most deprived schools to the least deprived schools.” We can see that many of the areas now targeted for support have been among the hardest hit by education cuts over the last decade—on the Government’s own watch, and entirely of its own making” (Anonymous, 2022).

So many parents whose first choice would be mainstream inclusion in England are now voting with their feet or going to the First Tier Tribunal in increasing numbers to place their children in special schools. The pressure cooker atmosphere of high stakes testing, high levels of disabilist bullying, the lack of appropriate curriculum, together with increasing levels of mental health issues among pupils and pressure from schools to leave, have forced the highest level ever of children with SEND to be out of the mainstream in 2021.

Table 1 shows us that the number of 5–16-year-olds identified with a special educational needs statement or latterly an Education Health and Care Plan has gone up from 2.4% to 3.6% of the school population, even as the school population has risen by more than 1 million. This number plateaued at 2.8% from 2006 to 2010 and then rose again. A conscious policy to increase inclusion in mainstream schools of disabled children, introduced by the Labor Government of 1997 did have an impact until 2006 when 59.1% of those identified with a Statement were in mainstream provision. This figure went down to 49.2% in 2016 and in the last year has gone back to 50.4%, but there were far more children impacted. From 2010 we had a Conservative Government (in Coalition 2010–2015) to the present with a policy of choice and setting up academies, and are lukewarm on their international obligation to inclusion. If those in Pupil Referral Units and all types of special schools with and without a plan are added, this gives the highest ever recorded figure of 1.94% educated in separate (segregated) settings in 2021 in England. So, Government policies do impact on the level of Inclusion!

Interestingly, Scotland and Wales who have devolved powers in Education have not introduced any of the above measures and although strapped for cash, are both committed to develop fully inclusive systems as the ruling parties in their governments are committed to incorporating the UNCPRD (2006) fully into their Domestic Law.

So, what does the UNCPRD Committee think Inclusion is?

10. Inclusive education is to be understood as:

- (a) A fundamental human right of all learners. Notably, education is the right of the individual learner and not, in the case of children, the right of a parent or caregiver. Parental responsibilities in this regard are subordinate to the rights of the child;

Table 1 Secondary schools, England.

Source: DFS, DFES, DfE Annual SEND Statistics*NMSS Non-Maintained Special Schools, PRUs Pupil Referral Units. +Statement was a legally binding certification of SEN and provision following a multidisciplinary assessment. In 2014 this was replaced with a statutory Education, Health and Care Plan (Rieser, 2022).

- (b) A principle that values the well-being of all students, respects their inherent dignity and autonomy, and acknowledges individuals' requirements and their ability to effectively be included in and contribute to society;
- (c) A means of realizing other human rights. It is the primary means by which persons with disabilities can lift themselves out of poverty, obtain the means to participate fully in their communities and be safeguarded from exploitation ([Committee on Economic](#)). It is also the primary means of achieving inclusive societies;
- (d) The result of a process of continuing and proactive commitment to eliminating barriers impeding the right to education, together with changes to culture, policy and practice of regular schools to accommodate and effectively include all students.

Change in school systems must be primarily led by regular or mainstream schools changing themselves to accommodate a wider diversity of pupils. But as we have seen above, the conditions that prevail from Government and to a less effect from Local Authorities do set the climate in which school change occurs. Focusing on (d) above the *Index for Inclusion* was a self-evaluation tool developed in UK, but then adapted for use in over 70 countries with 34 different language translations, for schools to self-evaluate how inclusive they are by asking a series of questions of different stakeholders in the school-teaching staff, support staff, parents, students and leaders about the culture, policies and practices of schools. The school as a whole can then identify a plan to become more inclusive, by removing the barriers so identified ([CSIE, 1997–2010](#)). As a member of the original working group of the *Index for Inclusion*, the author was the only disabled person and we had strong debates about whether it should be based on the social model of disability. In the end the Center for Studies of Inclusive Education agreed and Mel Ainscow and Tony Booth, the main authors, had to agree as can be seen in an endnote of the published "Index." The "Index" is about including all students but without the conscious underpinning of the social model it would not have included the wide variety of students with different impairments.

The index for inclusion has three key dimensions

- A. Creating an Inclusive Culture
 - 1. Building Community
 - 2. Establishing Inclusive Values
- B. Producing Inclusive Policies
 - 1. Developing Schools for All
 - 2. Organizing Support for Diversity

C. Evolving Inclusive Practice

1. Orchestrating Learning
2. Mobilizing Resources.

This remains the best school self-evaluation tool and now with greater emphasis on developing inclusion it should be developed and rolled out to schools globally. Applying the paradigm shift from traditional/charity/medical model approach to the social model/human rights approach to schools and educational systems is the crucial transformation that is required to bring about critical understanding of what needs to change.

Developing inclusive education theory into practice

The theory of developing inclusive education is clear, but putting it into practice is an altogether more complex process, strewn with barriers and unforeseen obstacles.

The **London Borough of Newham** is an early example in England. Below is a write-up from the *Disability Equality in Education Developing Inclusive Education Course Book* (*Disability Equality in Education*, 2002) (Table 3).

The London Borough of Newham believes in the inherent equality of all individuals irrespective of physical or mental ability. It recognises, however, that individuals are not always treated as equals and that young people with disabilities experience discrimination and disadvantage. The Council believes that segregated special education is a major factor causing discrimination. We therefore believe desegregating special education is the first step in tackling prejudice against people with disabilities and other difficulties. They have been omitted from previous Equal Opportunities initiatives, and it is now obvious that our aim of achieving comprehensive education in Newham will remain hindered while we continue to select approximately 2% of school pupils for separate education ...

It is also the right of pupils without disabilities or other difficulties to experience a real environment in which they can learn that people are not all the same and that those who happen to have a disability should not be treated differently, any more than they would be if they were of a different ethnic background. It is their right to learn at first-hand about experiences which they will possibly undergo in future, either themselves or as parents ...

Desegregating special education and thus meeting the needs of statemented children in mainstream schools will also contribute, by the entry of expert qualified staff into mainstream schools, to improved provision for the considerable number of children who already experience difficulties.

London Borough of Newham (1987).

In 1984 a group of parents of disabled children ran for and were elected onto the Council with the express wish of seeing the ending of segregated special education. They achieved their aim in a Council policy which recognized the rights of children, whatever their needs, to learn together (see above).

The Borough's latest policy has a goal of making it possible "for every child, whatever special educational needs they may have, to attend their neighborhood school". In the 12 years, 1984–1996, the number of special schools in the borough has been reduced from 8 to 2 (now 1) and the number of children segregated in special education has dropped from 913 to 206. Parents are becoming increasingly confident in the ability of their neighborhood school to meet diverse needs and teachers have signed an agreement on inclusive education. This was achieved in an educational and political climate that was hostile to this process. Resourced schools were set up to meet certain needs in mainstream schools as a response to parental concerns. These are now planned to be phased out as Newham moves to inclusive neighborhood schools.

The process from the start envisaged radically changing mainstream schools rather than fitting children with SEN into the existing system. An independent report commented that having to cater for children with serious learning difficulties helped schools

Table 3 Percentage of pupils with statements in different kinds of provision.

Placement	1986 (%)	1996 (%)	2001 (%)
Newham special schools	68	9	1
Out-borough residential schools	11	3	6
Out-borough day schools	6	5	7
Mainstream schools	7	63	79
Resourced mainstream schools	8	20	7

The London Borough of Newham (Jordan and Goodey, 1996) provides a useful indicator of how such moves toward inclusion can occur in a poor, multi-cultural, inner-city area.

make better provision for all pupils. This is born out in 1997–2000. Newham schools have the biggest improvement nationally in the GCSE results of all pupils in grades A-G. Many children labeled as having severe learning difficulties are now passing exams. In addition, the numbers of exclusions have been falling while they have been rising in most other areas of the country. The process is continuing with some schools inclusive, others realizing they have a long way to go and some struggling. The Local Education Authority/(Municipality) has now appointed four monitoring officers to pro-actively address this process of developing inclusion from integration.

Newham schools have also had the lowest levels of exclusions in London.

Postscript: 20 years on. The introduction of Academies, cuts in budget impacting on central support teams and school funding for additional needs, pressure from a minority of parents who want segregated provision for their autistic children and not maintaining systematic training on inclusion is all leading to pressures to restart special schools. However, the legacy of the reforms is that Newham still has the lowest level of students with EHC Plans and the lowest number of students educated in special schools of any English Local Authority in 2021.

Filming inclusive practice in English schools

In 2003, the Disabled People's Organization and Charity, *Disability Equality in Education* of which I was the founder and CEO, was approached by the Department of Education to find a range of mainstream schools across England that were good at making Reasonable Adjustments for a wide range of disabled pupils and students. We had previously been supported by a government grant to develop a network of disability equality trainers and materials to work with school staff. We were providing this training in many areas and by our closure in 2008 had provided it to more than 100,000 education staff. In 2002 the Education Amendment Act had become law and extended the duty of making reasonable adjustments for disabled pupils and students in all educational settings. We wrote to 10,000 mainstream schools with a questionnaire about their good practice. Over 400 replied wishing to have us visit and film their adjustments for students with sensory impairment, physical impairments, intellectual impairments, behavioral difficulties and medical needs. We selected around 90 some of whom had been making these adjustments for some time and others were just beginning. We eventually selected 41 schools around the country and set up 2 tranches of visits with a film crew. A telephone interview was held to set up a schedule of classes to visit and staff, parents and students to interview. Parental permissions to film were also obtained. Over 100 h of film was eventually edited down to 5.5 h and put on DVDs which were made available to all schools (DFES, 2006). The 20 secondary schools, 18 primary schools, 2 Early Years settings and 1 special school featured were all making innovative and imaginative efforts to make reasonable adjustments, leading to good inclusive practice. The practical adjustments were clearly leading to a range of students being effectively included who would not have been in mainstream schools previously (The films can be seen).

We interviewed the principal or headteacher of these schools and there was a unanimity of ethos and values that probably marked them out from the majority of schools at this time:

- vision and values based on an inclusive ethos
- a “can do” attitude from all staff
- a pro-active approach to identifying barriers and finding practical solutions
- strong collaborative relationships with pupils and parents
- a meaningful voice for pupils
- a positive approach to managing behavior
- strong leadership by senior management and governors
- effective staff training and development
- the use of expertise from outside the school
- building disability into resourcing arrangements
- a sensitive approach to meeting the impairment specific needs of pupils
- regular critical review and evaluation
- the availability of role models and positive images of disability

The tragedy is that I have been in touch with many of these schools and this good practice can no longer be found in many of these schools. The education “reforms” with the setting up of Academies and Academy chains, loss of central support teams of disability expert teachers, and tightening of budgets all have made inclusion harder, but not impossible in English schools. Though it is still possible to find schools with good inclusive practice (Inclusion Working, 2017).

Champions of inclusive education

All over the world at the heart of the move to inclusive education have been pioneering parental champions who do not understand why their disabled children should not have access to education in regular or mainstream schools. When they link up with disabled people's organizations, they can create strong Alliances for Inclusive Education.

In 2008 in **South Africa**, I met Marie Schoeman who was working at the Ministry of Basic Education leading on implementing Inclusion. South Africa in its new democratic phase had committed to White Paper No. 6 on Inclusive Education and the Constitution guaranteed equal treatment for disabled people including in education. Marie like a number of parent advocates, had fought for her son with Downs Syndrome to go through mainstream schools. The following year (2009) I returned to South Africa to make a film of inclusive practice in 10 primary schools in 4 Provinces ([World of Inclusion, 2009](#)) arranged by Marie. There were some full-service schools which were being additionally resourced to take a full diversity of disabled children and we captured some excellent practice and interviews. The plan was also to change existing special schools into resource centers.

In 2008, I had been to 3 of these resource centers and they seemed to be using their extra resources to recruit more disabled students rather than support the surrounding schools. I also carried out a series of seminars to educationalists in 5 Provinces in 2009. We would call the gate keepers -principals of special schools and Educational Psychologists were vociferous in their opposition to inclusion—perhaps because of their vested interest? At this time some 300,000 disabled children were not attending school in South Africa.

Money from the Ministry for developing Inclusive provision was allocated locally in the provinces, and it appeared that much of this was going to open new special schools. This is a short-sighted policy, as now there are some 600,000 disabled children not in school ([wayside](#)). The lesson from this for me is that Governments need to have robust plans with the funding tied down to deliver inclusive provision with strong monitoring and penalty arrangements.

Bringing parents, educational professionals together in an Alliance for Inclusion makes for a very powerful campaigning body and being one of the founders of the Alliance for Inclusive Education in the UK in 1990 was important in campaigning for and getting through the repositioning of the Labor Government 1997–2010 to support Inclusive Education ([Alliance for Inclusive Education](#)).

Equally, organizations of parents where they take on the thinking of the Disabled People's Movement and become allies to their children in their struggle for Inclusive Education is very important.

"In the UK Parents for Inclusion was formed in the 1980s by parents who wanted inclusion for their disabled children and disabled activists—a fusion which led to an entirely new perspective, so that parents became allies in their children's struggle. Parents for Inclusion's mission statement says: We believe that it is physical and social barriers that stop disabled children from being included, rather than the disabled children themselves. Children often have little power to ask for what they want. They say they want to be able to make friends and be involved in their local community. They want to be able to get out and about, meet new people, enjoy their leisure time and go to their local school. Parents and professionals have great influence over these children's futures. So, we work with them to help them see children as individuals first, with human rights and preferences and a right to an optimistic and self-determined future. Training: All our training is designed and delivered in partnership with experienced trainers. One trainer is a disabled person and the other is the parent of a disabled child. Listening to disabled people allows parents to see the world from their child's point of view" ([Rieser, 2012](#)). This work with Parents for Inclusion was a vital part of building the Alliance for Inclusive Education.

Identifying and removing barriers to inclusive education

From the distilled experience of schools that have successfully included, school systems such as in Canada (New Brunswick, British Columbia), Finland, Italy, Portugal, Spain, Brazil, New Zealand and India and hundreds of small-scale NGO inclusive education projects across developing countries we know what works. The task is to resolve the barriers, ([Fig. 5A](#)) at school level and ([Fig. 5B](#)) Systemic barriers (below) ([Commonwealth Secretaria](#)).

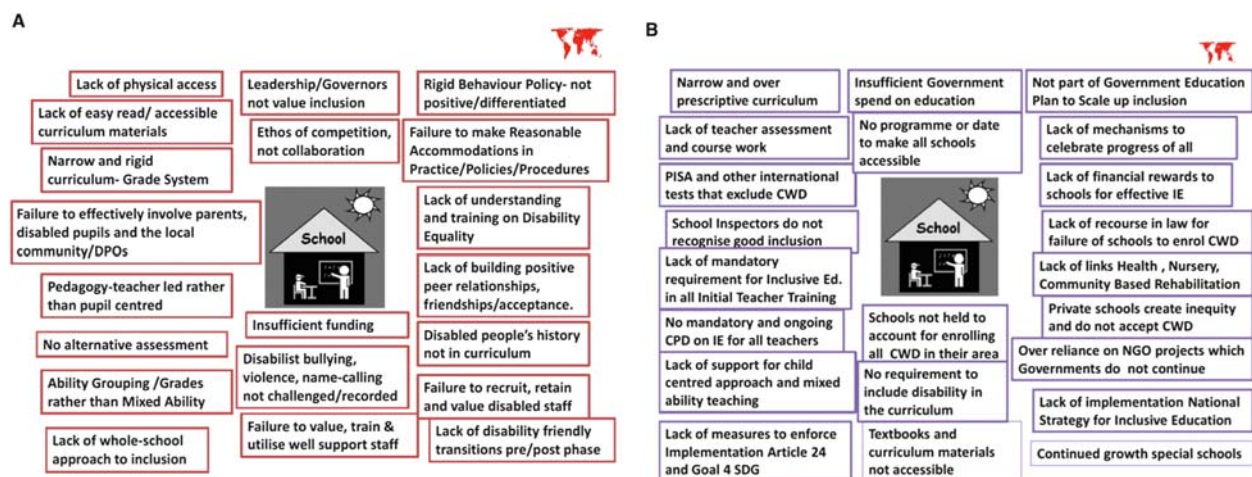

Fig. 5 (A) School barriers to the inclusion of children/students with disabilities. (B) Systemic barriers to the inclusion of children/students with disabilities.

Possible solutions

*The community can build/alter school-build ramps, widen and improve toilets, whiten walls. *Turn desks round into work tables and get students to peer support. Mix groups carefully. *Inclusion training in the community to get all children to school. *Train all teachers in the District on an aspect of inclusion and to make resources to access the curriculum for learners with different impairments. *Link with a University to train all teachers on inclusion involving action research in school, accredit and remunerate those successful. *Ensure all students and staff know where prejudicial attitudes come from, how to challenge them and include knowledge of the history and treatment of people with disabilities in their curriculum. *Teachers develop child centered approaches and adjust their practice to enrich each child. *For students vulnerable to dropping out or exclusion build strong peer support. *Make films of good practice in similar situations and promote.

Conclusion

The Global Summits on Disability in 2018 and 2022 have recorded increasing interest from Governments in supporting the development of inclusive education ([International Disability, 2018](#)). In 2020 UNESCO's Global Monitoring Report on Education Focused on Inclusive Education ([UNESCO, 2020](#)) focused on global inequalities and how to remedy them such as:

- * In the case of students with disabilities, laws in 25% of countries (but over 40% in Asia and in Latin America and the Caribbean) make provisions for education in separate settings, 10% for integration and 17% for inclusion, the remainder opting for combinations of segregation and mainstreaming.
- * Some 25% of teachers in 48 education systems report a high need for professional development on teaching students with special needs.

All these statistics and now inclusive education has been put back by the COVID Pandemic.

The 2020 Global Education Monitoring Report coincided with the International Disability Alliance (IDA) producing a Report that was supportive of developing Inclusion for people with all forms of impairment. During the debates around making the UNCRPD there had been significant divisions between the Deaf, Deafblind and Blind organizations and those representing learning difficulty such as Inclusion International and cross impairment organizations such as Disabled People's International that led to the weak formulation of Article 24. That weakness has been rectified by the UNCRPD Committee in General Comment 24. However, it was heartening to have a unifying Report from IDA ([International Disability Alliance, 2020](#)).

The report includes recommendations of good practices supported by policies and legislation, leading to truly inclusive education systems. It puts forward measures required to build an inclusive education system, geared toward providing quality education for all children and youth equitably. A critical message is that an inclusive education system is the only way to achieve SDG 4 for all children—including disabled children and youth—whomever and wherever they are. Inclusive education requires an educational transformation, which is unachievable if it is considered an add-on to existing education systems.

The IDA Report proposes "that including children and youth with disabilities—requires the following **minimum conditions**: (A) All Children/learners have access to quality education in schools where their inclusion requirements are met; (B) All teachers are equipped to ensure that all their students participate in quality learning; (C) Well-resourced support services and resources are available to assist all schools and all teachers to provide inclusive effective learning to all learners including those with disabilities; (D) All students succeed in reaching their full academic and social potential with learning outcomes measured against their own wishes, plans and benchmarks."

While the IDA analysis presents a way forward, caution is needed. IDA argues that specific impairment DPOs should provide the advice to schools and governments on impairment specific adjustments. Contained in the Annex of the Report. While these reasonable adjustments and support are needed, in a world where the large majority of disabled children if in school attend special schools, this is a dangerous strategy that could play lip-service to full inclusion, while reinforcing segregation. The retention of special schools while they transition to inclusive schools is also a dangerous strategy, as the evidence shows they take the extra resources offered and remain an expanded version of themselves. Experience shows the management and accountability measures need to be changed for this transition to be successful.

It is much better if cross-impairment DPO Councils or coalitions, with parents, provide this support and advise drawing on the wealth of experience from their members to cover the full range of impairments. The IDA approach is likely to lead to separate silos, with some groups such as psycho-social left out, rather than full disability equality ([Rieser, 2020](#)).

As we look to achieving the Sustainable Development Goals and in particular SDG No. 4 Quality Inclusive Education for All by 2030, we are a long way off-track.

We need now a new Global movement for Inclusive Education bringing parents, disabled young people, educators and the Disabled People's Movement together. The internet has demonstrated its power in building strong Global Movements on the Climate Emergency and Black Lives Matter. We know what needs to be done, but we need a A Global Alliance for Inclusive Education to make it happen.

Introduction

The quotation in the title of this chapter comes from the chorus of a song by Yusuf Islam (aka Cat Stevens):

I know we’ve come a long way
We’re changing day to day
But tell me, where do the children play?

The song is about urbanization, pollution and the loss of green-spaces for children to play, yet its chorus has lodged in my mind because it also speaks to the issue of the inclusivity of play. Progress has been made in recognizing disabled children’s¹ right to play. Things *have* changed. Things *are* changing. In *some* places. When compared to thirty years ago, there is now greater recognition of the need to move beyond individual model (often termed “medical model” or “deficit model”) articulations of the “problem” of disabled children’s play. We have a better understanding of the many and varied barriers—beyond their minds and bodies—that limit disabled children’s access to and inclusion in play. It is more common to see researchers, practitioners and governments espousing rights-based approaches to all children’s play, including that of disabled children. The topic of play for disabled children is receiving ever more attention from researchers in various disciplines, including children’s geography, occupational therapy and design. We have seen initiatives such as the LUDI Network (a European Cooperation in Science and Technology [COST] Action) which brought together researchers from many different disciplines (including psychologists, sociologists, designer/engineers), civil society organizations and the play industry with the objective:

to spread awareness on the importance of giving children with disabilities the opportunity to play, while ensuring equity in their exercise of the right to play²

It is possible to identify position statements, play policies and various initiatives that recognize and seek to support disabled children’s right to play. For example, in 2015 the International Play Association (IPA) published a Position Statement on the Play Rights of Disabled Children which emphasized that:

Disabled children have the same right as other children to sufficient time and space to play freely, in the ways they choose, without being unduly overprotected

IPA (2015, para. 2).

¹Herein I follow the UN Convention on the Rights of Persons with Disabilities in understanding disability as “relational”—resulting from “interaction between persons with impairments and attitudinal and environmental barriers that hinder their full and effective participation in society” (UN CRPD, 2006 para. e). Whilst the UN CRPD adopts people first language (“persons with disabilities”/“children with disabilities”) I use identity-first language (“disabled people”/“disabled children”) because this is the preference of the UK disabled people’s movement and is aligned with the UK social model of disability and because I value the political operations of the social model. Further, since this model informed the articulation of the CRPD (Lawson and Beckett, 2021), the use of identity-first language is not fundamentally at odds with the spirit of the convention.

²<https://www.ludi-network.eu/about-ludi/> (accessed 18/07/22).

The inclusive playgrounds movement has grown over this period and the idea that we should be providing spaces and opportunities for disabled and non-disabled children to have fun together, has been influential. One example, amongst many, is the ‘Morgan’s Inspiration Island, San Antonio, Texas’—an inclusive waterpark with many accessible features available, including waterproof wheelchairs (see Fig. 1). The park was opened by disability advocate Gordon Hartman, who has stated:

Morgan’s Inspiration Island is not a special-needs park; it’s a park of inclusion (...) designed with special-needs individuals in mind and built for everyone’s enjoyment. Our goal is to provide a great guest experience in an inclusive, safe, comfortable, not-overly-crowded environment (...) without barriers.³

Yet despite these positive developments, disabled children continue to be at risk of experiencing play deprivation or play bias (exclusion from a full play experience) (Hughes, 2003). The question “where do the children play?” thus remains pertinent for these children. In this chapter I ask, why and how is this the case and set forth an agenda, not only for ensuring disabled children’s right to play, but also for *emancipating* their play.

The chapter is organized into three further sections and a conclusion. In Section 2 I outline how disabled children’s right to play is enshrined in international law. I explain how play has been defined/interpreted by the Committee on the UN Convention on the Rights of the Child and why their interpretation is important. In Section 3 I provide a narrative review of existing knowledge about the barriers to play for disabled children, focusing on literatures that consider disabled children’s access to and inclusion in play at home, school and in the community (e.g., at public playgrounds). In Section 4, I take a closer look at a set of barriers resulting from the discursive framing of disabled children’s play within the health and psy-sciences (especially, educational psychology). It is here that my immersion within ‘Disabled Children’s Childhood Studies’ (DCCS) and adoption of a DCCS perspective is most apparent.

This chapter includes two case-studies (see Figs. 4 and 5). The first is drawn from a research project that explored barriers to play for disabled children living in Hong Kong and Taiwan. This case study provides insights into barriers to play for disabled children living outside the “West”. The second is drawn from a project conducted in the UK, entitled “Together Through Play”. This case study demonstrates the children’s capacity for “design thinking” and why it is important, and valuable, to involve them in inclusive play design projects.

Also interspersed throughout the chapter are a series of vignettes. These are derived from the research journals/field-notes I have kept during various studies that involved observations of disabled children playing or in play situations. In *Vignette 1*, which ends this section, the reader is introduced to Freddy, for whom play is a serious business. These vignettes are included in order to: (a) bring the voices and perspectives of children into this chapter; and/or (b) to provide insights into the ways that disabled children’s agency is revealed in and through their play.

Fig. 1 Children playing at the Morgan’s Inspiration Island. Photo credit: Robin Jerstad/Jerstad Photographics.

Vignette 1 Play Is a Serious Business

I am sitting quietly in a classroom of primary-aged children, aged 7–8 years, observing. The children have just returned from playtime and the teacher is getting them settled to tasks. There is a lot of movement in the room—children are getting out exercise books, fetching coloring pencils and so on. I notice that one little boy—Freddy (not his real name)—is doing something different. He’s moving around the room in a very careful, surreptitious or stealthy way, mostly below the tables, or behind the bookcases. The teacher also notices and calls out to him that “playtime is over”, “stop messing about” and “please focus on the task”.

Freddy has recently been diagnosed as having Asperger’s Syndrome. His teacher has opened up to me about it. She has explained that she’d thought he was “not very bright” and had been very anxious that because he was not concentrating in class, that he might “ruin the SATS results for the class” (national tests). The educational psychologist who diagnosed Freddy has said that he is very intelligent and has given her an A4 leaflet about Asperger’s. He cannot provide any other support because he’s got too heavy a case-load. The teacher bursts into tears, tells me how guilty she feels and promises to go to the library and “read up” on things, so she can support Freddy better.

Intrigued by Freddy’s behavior in the classroom and having developed a good rapport with him, I beckon him over and casually ask him what he’s up to. What game is he playing, moving around the classroom so secretly?

He leans in and whispers to me in a conspiratorial manner: “Well, it is a game yes, but *really* I’m practicing subterfuge”.

The right to play

The right to play is enshrined for *all* children in Article 31 of the UN Convention on the Rights of the Child (CRC, 1989) and reinforced for disabled children by Article 30 of the UN Convention on the Rights of Persons with Disabilities (CRPD, 2006):

UN CRC (1989) Article 31 “States Parties” must: ... recognise the right of the child to rest and leisure, to engage in play and recreational activities.

UN CRPD (2006) Article 30, 5d “States Parties” must take appropriate measures to: ... ensure that children with disabilities have equal access with other children to participation in play, recreation and leisure and sporting activities, including those activities in the school system.

There is also a General Comment (GC17, 2013, on CRC, Art. 31, see UN CRC, 2013) on the “right to play”. This quasi-legal document provides authoritative interpretation of an area of international law. GC17 offers important guidance regarding how play should be understood, for all children. It distinguishes play from “play-like” activities (e.g., play therapy) and adopts a concept of play that, in Play Studies, has come to be termed “free play”. One of the best-known definitions of the latter has been provided by Garvey (1990) who defined free play as: a) pleasurable; b) having no extrinsic goals; c) being spontaneous and voluntary; and d) involving some level of player engagement.⁴ Free play occurs when children decide “what they want to do, how they want to do it and when to stop and try something else” (Santer et al., 2007: xi). It is play free from adult-agendas. Having opportunities for free play is important for children and young people’s mental health, overall well-being and quality of life. Play “is more than an enabler or a tool in relation to social, educational, physical and psychological development and health promotion/maintenance” (Barron et al., 2017: 1). Play has intrinsic value for all children.

GC17 also stresses that children’s right to play intersects with all other principles of the CRC including non-discrimination (Art. 2) and children’s right to express their views and be listened to (Art. 12) and reminds us that disabled children are also afforded similar rights under the CRPD. The authors of GC17 identify disabled children as a group facing barriers in/to their play. Of the “multiple barriers” identified in this general comment, all lie external to the minds and bodies of children. This is important. It is a position echoed by the IPA (2015: np) which has stated that the barriers disabled children face in/to their play lie beyond their impairments in: (a) “inaccessible facilities and environments, negative attitudes and inappropriate social policies and programmes”; and (b) “the imposition of activities determined by adults” onto disabled children’s play.

All States Parties that have signed and ratified the CRC and CRPD are obliged to put in place an appropriate set of policies and programmes to ensure their realization. Sadly, however, this does not always happen. As a “snapshot”, between January 2021–June 2022, of the twenty-five Concluding Observations published either by the Committee on the CRC or Committee on the CRPD, twelve reference concerns or recommendations that relate, in some way, to disabled children’s right to play (or to their participation in leisure/sport) or importance of providing accessible spaces for recreational activities. It is regrettable that the remaining Concluding Observations neglect the right to play. This appears, however, to be because the committees have prioritized issues such as the failure of States Parties to ensure disabled children’s right to education, have wanted to highlight the precarious lives of disabled children in particular countries, or have sought to expose the significant human rights violations disabled children are experiencing in other areas of their lives (e.g., as a result of institutionalization). It is at times difficult to argue that greater

⁴NB. there is no set level of “engagement”. A giggle or smile, or a blink of an eye may be meaningful engagement.

attention to be given to disabled children’s “right to play” when there are even more pressing issues at stake, such as ending the neglect and abuse many disabled children face within institutional settings (congregate care).

Nevertheless, it is important not to forget the “right to play” and to hold governments to account in this respect. As is evident from just 18 months of Concluding Observations from the CRC and CRPD Committees (and the issue can be traced into *many* more of these documents prior to 2021), governments are failing to take their obligations seriously when it comes to supporting disabled children’s play.

At the time of writing, it is not known how many countries have a national play policy or program that references the needs of disabled children. What is known is that where play policies do exist or have existed, they have not always been well implemented, evaluated or enforced. There is also evidence that these policies are vulnerable to the ebbs and flows of politics. A case in point would be in England. In 2016 the CRC Committee (UN, 2016) expressed concern that children’s views are not being systematically heard in policymaking on issues that affect them (also implying contraventions of domestic law in the Children’s and Families Act, Part 19) and that measures to support disabled children’s play were not always being taken. They highlighted withdrawal of the Play Policy for England and inadequate resourcing of disabled children’s play in this national context. The situation in England is not unusual.

To conclude this section: disabled children’s right to play is enshrined in international human rights law, within the CRC and CRPD. Has this been sufficient to ensure that their right to play is respected? The answer is of course, no, or *not yet*. CRC Article 31 and CRPD Article 30 do, however, provide an important moral horizon and act as route-maps for change. Further, the concluding observations of the two committees are part of an international monitoring process. They contribute to the delineation of relevant standards. Concluding observations have the potential to include positive recognition of successful strategies or innovations undertaken by governments to protect disabled children’s right to play; as well as criticism for regressive developments or failures to act. Neither Committee has the power to “punish” States that do not guarantee disabled children’s right to play by imposing sanctions. Nevertheless, “the reputational implications of public criticism from such a body has the potential to damage the standing of governments both internationally and at home” (Lawson and Beckett, 2021: 369). Further, at a national level, in countries which adopt a monist approach to international law, there is the potential for the CRC and the CRPD to be used in courts—opening the possibility that disabled children’s exclusion from play opportunities or play spaces could be legally challenged.⁵

UN CRC and CRPD ‘Concluding Observations’ January 2021–June 2022

June 2022

CRC on Greece (G.33.i): the committee recommends the government attend to ‘regional disparities...including access...to **leisure and play**’ for disabled children.

CRC on Cambodia: the committee recommends the government to provide ‘**accessible playgrounds**’.

CRC on Canada (H.40.e.): the committee recommends the government works to guarantee the right to ‘**play and accessible recreational activities**’ for all children (my emphasis).

CRC on Croatia (I.40): the committee recommends that the government provides ‘children, **including those with disabilities**...with safe, **accessible, inclusive and smoking-free places for play**...with public transport to access such spaces’ (my emphasis.)

CRC on Chile (G.37.b.): with regard to disabled children, the committee recommends that the government puts in place ‘legislation, policies and programmes to facilitate their access to sports facilities’.

March 2022

CRPD on Hungary (B.58): the committee is ‘concerned about the remaining barriers to access to recreational, leisure and sporting venues’ particularly for ‘children with disabilities’.

CRPD on Jamaica: committee makes statement similar to that made vis-à-vis Hungary.

September 2021

CRC on Poland (I.40): the committee recommends that the government ‘strengthens its efforts to guarantee the right of children, in particular children with disabilities, to...**sufficient time to engage in play** and recreational activities that are safe, accessible, inclusive, reachable by public transport and age-appropriate’.

CRC on Switzerland (H.41.a.): the committee recommends that the government ensures that ‘sporting, leisure...activities and accessible for children with disabilities’.

CRPD on France (B.60): the committee is concerned about ‘**lack of play, recreation and leisure and sporting activities for children with disabilities**’.

CRPD on Estonia (A.59): the committee recommends that the government ‘should promote inclusive recreational, leisure and sporting activities for...children with disabilities’.

June 2021

CRC on Luxembourg (F.23.f.): the committee recommends that the government take ‘all measures necessary to provide children with disabilities with reasonable access in all settings including at school and in leisure centres’

(Emphasis added by author)

References to play/leisure/recreation within UN CRC and CRPD Committee’s Concluding Observations Jan 2021–June 2022.

⁵There is need for increased legal advocacy in this area. Geary (2012) for the Child Rights International Network found CRC, Article 31 to be a neglected article, seldom (he found zero) referenced in court cases deemed to be important with regard to their interpretation of children’s rights.

Barriers to play for disabled children

The previous section introduced the international legal frameworks and discourse surrounding disabled children's rights to play and described how the CRC and CRPD committees recognize that disabled children face barriers in and to their play activities. This section explores these barriers as they exist within the social environment. Emphasizing that the main barriers to their play exist within the social environment, does not mean ignoring the reality of impairment. Impairments may present certain challenges for a child in/to play; but equally, they may not. The presence or absence of any particular impairment may simply result in different play preferences or experiences. Where impairment-effects *do* present challenges for the child in their chosen play, these challenges can often be overcome with the use of imagination or application of knowledge on the part of "allies" (families, friends, professionals). For example, it is helpful to raise awareness/understanding of how certain toys may be more user-friendly and interesting for children with particular impairments e.g., tactile or sound toys for children with visual impairments (Besio, 2017). Nevertheless, care should be taken to avoid focusing too heavily upon impairment. Such an approach tends to result in individualized approaches that are not always necessary and present attendant risks (e.g., of developing "special"/segregated provision, paternalistic or stigmatizing "solutions"). Further, disabled children have agency and often navigate impairment-effects themselves, in creative ways, without adult-interventions.

When it comes to disabling barriers to play within the social environment the first thing to note is that these often result from, or are compounded by, barriers that disabled children face in other aspects of their lives, beginning with poverty. Economic deprivation is a feature of the lives of many disabled children, globally (UNICEF, 2013). In many countries disabled children are not provided with basic services such as healthcare and education and are at higher risk of experiencing abuse or violence (UNICEF, 2013). The CRC General Comment 17 highlights disabled children's exclusion not only from school, but also from informal and social arenas where they might form friendships and where play takes place.

Within research and gray literatures, the inaccessibility of physical environments and non-inclusive design are the most frequently cited barriers to disabled children's play (e.g., Burke, 2013; Dunn and Moore, 2005; Law et al., 1999; Moore and Lynch, 2015; Rigby and Gaik, 2007; Rimmer et al., 2004; Olsen and Dieser, 2012; Woolley, 2013; Yantzi et al., 2010), especially in relation to playgrounds and other public play spaces. Insufficient, unsuitable or expensive public transport can mean a difficult, even impossible "journey to play" at suitable locations (Stafford, 2017). Noise and overcrowding when children are able to reach a play-site are known problems (Law et al., 1999; Rimmer et al., 2004). Play-spaces with unsuitable surfaces or lighting or that lack appropriately designed play equipment, can result in exclusion from play for disabled children. Poor design can mean that disabled children need adult assistance and are thus prevented from playing independently. Sometimes, the introduction of "accessible" elements to playgrounds (e.g., wheelchair swings), if not carefully positioned, have resulted in further segregation, even stigmatization, if they come to be perceived to be "special things for special children" and not fun for all (Dunn and Moore, 2005). An example of the latter would be the positioning of equipment such as wheelchair swings—there is often only one of the "heavier duty" versions of such swings on a playground (able to carry an electric wheelchair on a platform) and barriers or a perimeter may be constructed around the swing for health and safety reasons (see Fig. 2).

Disabled children sometimes self-exclude from poorly designed (or inadequately supported) play-spaces lest they be perceived to be less "able" within those spaces (Prellwitz and Skar, 2007). Poor design can result in internalized oppression. The issue of poor design of playgrounds has been recently highlighted in the UK by the charity Scope. Emma Vogelmann, disability activist and Lead Policy Adviser at the charity/non-profit Scope, was quoted in the Metro Newspaper (May 12, 2022) as follows:

Every child has an equal right to play. Play feeds imagination and forms friendships (...) Our playgrounds are places where memories are made and where children can be themselves. Yet many disabled children can't enjoy their local playground because the equipment isn't designed for them. It leaves disabled children shut out and missing childhood experiences.⁶

At the root of the problem and/or exacerbating the problem is insufficient knowledgeability regarding the concepts of inclusive and universal design amongst policy-makers, urban-planners and commissioners (Steinfeld and Maisel, 2012). Further, the expertise of disabled children and their families—born of lived experience of disabling barriers—is not always recognized. Researchers have found that children and families are seldom consulted adequately during playground design processes (Prellwitz and Tamm, 1999; Woolley, 2013).

At school, disabled children have been found to experience exclusion at playtimes. Yantzi et al. (2010) found that disabled children face barriers in school playgrounds—getting in, moving around and playing. This provokes feelings of being "abnormal" and not belonging amongst the children. Woolley (2006) found that Physical Education (PE) can be used to introduce skills in relation to inclusive play, that children can then transfer onto the playground. But even in this study, the authors found that if disabled children are delayed getting onto the playground, then they risk getting left out. Inclusion in play is a "fragile" thing. Vignettes 2 and 3 jointly entitled "Inclusive Play: Now You See It. Now You Don't" offer the reader additional insights into the ways in which

⁶<https://metro.co.uk/2022/05/12/disabled-children-are-being-excluded-from-playgrounds-16599216/> (accessed 16/07/22).

Fig. 2 Wheelchair swing at an inclusive playground in Taiwan—equipment located in separate/segregated enclosure for health and safety reasons. Photo: Author’s own.

PE might be used to encourage inclusive play. Yet these vignettes also demonstrate how easily positive developments can be undermined by non-inclusive educational environments and practices.

Vignettes 2 and 3 Inclusive Play: *Now you See it. Now you Don’t.*

V2: I arrive at the primary school. It’s a new building—very much “architect designed”. In the foyer a large sign reads “We’re a rights-respecting school” (referring to the UNICEF scheme of this name). The receptionist points me to the gymnasium where I’m met by a peripatetic PE teacher and introduced to the class. The children are juniors, aged 8–9 years old. The teacher reminds the children why I’m there.

Having been told that I’m observing the XXXX program (a games-based “intervention” designed to promote disability equality) being rolled out in a “usual PE session”, I’m surprised that almost half of the children have some type of visible impairment. This includes four children who are wheelchair users. I note how unusual this is. I wonder if I have chanced upon the most inclusive school in the UK?

The class begins. The PE teacher invites the children to warm up. “Everyone do some star jumps!”, he says, then quickly adds, “you in the wheelchairs, do something else”. One of the children who is a wheelchair user glances over to me and catches my eye. He gives me an obvious “long-suffering” look (eye-roll) in response to this instruction from the PE teacher.

After the session ends, I’m scheduled to speak to some of the non-disabled children who took part. I ask them if they enjoyed it? They say that they had. I ask which aspects? They reply that it had been good to meet “those other children”.

“Which other children?”, I ask them. Although, of course, I know. They tell me that they meant the disabled children.

“Aren’t they members of your class then?”, I say. They tell me that the disabled children are not usually in their PE sessions because they are part of a “different class”. That class has a classroom “on the other side of the playground”.

I realize that they are describing a unit for children with “special educational needs”, which is supposed to be part of this mainstream school – but really *isn’t*.

I ask the children if they have shared playtimes with the disabled children from the unit. They tell me they do not and *have never met them before*.

~~~~~

V3 (different school): I have just observed a session being run by one of the school partnership/outreach coaches from a Premier League football club in the South of England. It’s a session meant to promote disability equality and inclusion. The children are aged 8–9 years. They have been playing Chair Football. To make the session more accessible for all the children in this class, the coach has opted to ask the children to sit on the floor. Although none of the children are visually impaired, he has brought a bell ball with him and explains its purpose. There has been discussion about making games accessible, so everyone can join in.

As scheduled, some of the non-disabled children are chatting to me. I ask them if they enjoyed the session. They say that they did. One child says that the activities had been fun because everyone was able to take part, “no matter their abilities”. Another, who seems very excited, tells me that the session had been “helpful” for “when we’re playing on the playground” and suggests we could “take some of the ideas ... onto the playground and make them public!”. The others agree.

Later, I go to observe the children during playtime. They have set up another game of what they are calling "Sit Down Football". The game is in full swing and the players include a disabled child who has cerebral palsy. A teacher who is standing close to me observes that it's "really nice to see him being included in the game because he's often left on the side-lines".

A few minutes later—long before the end of playtime—a teaching assistant appears on the playground and leads the disabled child away from the game and back inside the school building. I ask why. The teacher explains that it's "necessary". He would "need to go to the toilet before class begins and that can take a while, so he always goes in early from playtime".

At home, lack of space can impact negatively upon disabled children's play. Researchers have found that barriers to play in the home include insufficient space for wheelchairs to maneuver, or necessary pieces of equipment (e.g., hoists) taking up potential play-space (Brotherson et al., 2008; Connors and Stalker, 2003). Late or no adaptations to a home (e.g., absence of a stair-lift) can reduce children's independent mobility, impacting on their play. Kuhaneck et al. (2010) found that toys are seldom designed to be accessible by children with a wide range of abilities and "adapted" toys often offer limited play options, lacking the degree of challenge for enjoyable play experiences. Toys that are suitable for a child's abilities are often inappropriate for their age (Kuhaneck et al., 2010). If the only toys a child can access are designed for younger children, this can become a barrier to their inclusion within their peer-group (Kuhaneck et al., 2010)—it's "just not cool" to be playing with toys that are meant for younger children.

Perhaps the most stubborn barriers to disabled children's play lie in the attitudes of peers and adults. Jeanes and Magee (2012) advise us not to romanticize play or imagine that because a play space, for example a playground, is well-designed, accessible and has the potential to be an interesting, fun environment, that it will be a safe, happy place for all children. They remind us that "play can be a place of power dynamics" and "playgrounds can be sites where young people define and legitimize social hierarchies". Attitudes held by non-disabled peers can lead to exclusion of disabled children from play (Mencap, 2007; Spencer-Cavaliere and Wilkinson, 2010). Negative peer attitudes have led to disabled children becoming withdrawn, anxious or depressed (Baumeister et al., 2008; Contact a Family, 2012). Disabled children are more likely to be bullied than other children (Connors and Stalker, 2003; McLaughlin et al., 2016). Disabled children do sometimes display bullying behaviors, but this is often an impairment-effect not understood by other children (e.g., a child might play roughly, accidentally hurting another child), or may be their response to bullying (Contact a Family, 2012). Both reasons require sensitive management of play situations by adults, and this does not always happen (ibid).

Well-designed play-spaces can thus be helpful, but we also need to develop more inclusive play cultures. Developing such cultures is not as simple as bringing disabled children and non-disabled children together in the same space and expecting that inclusive play will "happen", spontaneously. Sometimes it does. Often it does not. Wenger et al. (2021) found that social barriers amongst peers can present challenges for disabled and non-disabled children. They noted that whilst disabled children can be excluded by non-disabled children, disabled children sometimes felt (or assumed) that non-disabled children would not want to befriend them and thus "stuck together" in play contexts. Encouragingly, they found that when given the opportunity and encouragement disabled and non-disabled children displayed design-thinking about how games could be adapted to ensure everyone was included in the fun. Children's design-thinking was much in evidence in a research project that colleagues and I undertook entitled "Together Through Play" (Holt et al., 2014). Please see Fig. 3 and the description of – Button Bash – designed by friendship groups of disabled and non-disabled children as part of this project. This case study offers the reader insights into the ways in which "mixed ability" friendship groups can find solutions that allow everyone to be included and have an important part to play in the game.

Adult attitudes and behaviors can also become barriers to disabled children's play. For example, staff attitudes have been found to negatively affect access to natural environments and nature play for disabled children (Gleave, 2010; Shackell et al., 2008). Adult perceptions of risk figure highly here. Gleave (2010), for Play England, found that staff considered less supervised outdoor opportunities to be "too risky" for disabled children. In another study, Ludvigsen et al. (2005) found staff at a nature playground attempting to stop disabled children engaging in "messy" activities such as kicking and throwing leaves. Exaggerated perceptions of the risk of play for disabled children have also been found amongst some parents of disabled children (Connors and Stalker, 2003; Schlieien et al., 2014). Not all such concerns are unfounded. Nevertheless, so-called bubble-wrapping can constrain disabled children's free play. This can also be a problem in the school-setting and on school playgrounds, where research has shown that teaching staff who are risk-averse limit disabled children's opportunities to make choices, take risks, embrace challenges and make friends (Ozen et al., 2013; Richardson, 2002).

Even when adults are play-advocates they can exhibit unconscious ableism. This is particularly evident within the nature play movement, which has gained considerable momentum since the 2000s. The UK heritage organization the National Trust's campaign "50 things to do before you're 11 and 3/4"<sup>7</sup> (running to date, 2022) encourages children to climb a tree, jump over waves, go on a walk barefoot, run around in the rain, play conkers, climb a huge hill, try rock climbing, canoe down a river and build a raft. Similarly, the Yorkshire Wildlife Trust (UK) encourages children to:

take risks, hide, run, jump, swing, balance, climb, sit, talk and have fun<sup>8</sup>

<sup>7</sup>See <https://www.nationaltrust.org.uk/50-things-to-do> (accessed 19/07/22).

**Fig. 3** Together Through Play. (A) Children test the prototype of their design, (B) Button Bash, showing the game-characters designed by the children. (A) Photo courtesy of Principal Investigator, Together Through Play Project, Raymond Holt, (B) Photo courtesy of Raymond Holt.

There are disabled children who would be able to do some or all of these activities. There are disabled children who might be supported to engage in many of these activities. Equally, however, there are those for whom such activities would prove difficult, perhaps impossible. What does this signal? At best, we might conclude that this is a matter of “lazy ableism”—a failure to recognize that children are not a homogenous group or to imagine activities that cater for children with different abilities. At worst, there is a concern that such campaigns promote an “ideal” of the playful/playing child, and rest upon associated and “desirable” ability-expectations.

So far, I have drawn upon research and gray literatures from many different countries. Yet it is important to note that whilst there has been a growth in studies of disabled children’s experiences of play—from around the world—knowledge about play for disabled children outside the West and in the majority world, is still very patchy. More attention needs to be given to whether and how different cultural constructions of disability and childhood, varied social and family structures and myriad other factors (e.g., geographies, intersecting oppressions) impact on disabled children’s access to and inclusion in play. This is not to say that there are not some barriers that are faced by disabled children irrespective of where they live, but rather that it is likely that these have distinct local flavors or formations (Beckett et al., 2020). The latter is something that colleagues and I found, for example, in our study of access to and inclusion in play for disabled children living in Hong Kong and Taiwan. More studies are needed that expand our knowledge of disabled children’s experiences of play, particularly in the Global South.

To conclude this section: disabled children face myriad barriers to play—including economic, physical and attitudinal. In the final section of this chapter, we will turn our attention to how these barriers might be removed and disabled children’s play become “emancipated”. There is, however, one thorny barrier left to consider: the “adulteration” of disabled children’s play. It is to this issue that I turn in Section 4.

## The "adulteration" of disabled children's play

Play Studies is a highly interdisciplinary field. A rich history of research and theorizing from psychoanalytic, evolutionary and psycho-educational perspectives has unquestionably deepened our understanding of children's play. There is need, however, to be cautious and critical in the application of play theory when considering play for disabled children. This is because it has tended to (over)emphasize the relationship of play to child development and underemphasize its role in relation to wellbeing. This is especially the case with psycho-educational perspectives. In this section I engage critically with these perspectives.

### Together Through Play

During the Together Through Play project, funded by the Leverhulme Trust, we worked with friendship groups composed of disabled and non-disabled children. The disabled children had physical impairments (cerebral palsy). Supported by a researcher, each friendship group worked to develop a concept for a new game or toy they would like to play with together. Their ideas were developed into prototypes by students at the Faculty of Engineering and Physical Sciences, University of Leeds (UK). The children tested and helped to refine the prototypes. This case study describes one of the games designed by the children.

**Button Bash:** initially the children wanted this to be a videogame involving a hovercraft being steered around a race course by pressing buttons embedded within a floor mat. Lo-fidelity testing revealed that the children who had cerebral palsy found the game difficult to access due to the fixed positioning of buttons on the mat. Working with the children as co-designers, the game was reimagined as a video game controlled via large, very sensitive access switches. These could be positioned flexibly and pressed using any part of the body. The game play became something akin to 'whack-a-mole'. Buttons had to be hit to shoot a corresponding alien as it appeared on the screen. The revised version was more accessible. Nevertheless, inclusion of individual scores meant the children played competitively. This proved to be problematic for children with slightly slower reflexes (not only the children who had cerebral palsy). The children themselves identified the solution. They proposed that Button Bash could be modified to become a team-game. One of the disabled children suggested that it would be fun to work together to navigate a maze, each team member having a 'button' that moved the character either 'right', 'left', 'up' or 'down'. This necessitated a coordination of effort by the whole team. This cooperative game proved to be very popular.

Play is, of course, a site of/for informal learning. Further, play is essential for children's physical, cognitive, social and emotional development (Frost et al., 2012). It provides an outlet for and fosters their creativity, reflection and problem-solving. It helps them to gain self-esteem and "confidence to meet physical, intellectual and emotional challenges" (Whitebread et al., 2012: 31). Access to play is important for all children's subjective wellbeing and mental health (Hughes, 2012).

It was perhaps inevitable that because play has all these "benefits" that it would eventually be captured by a machinery of government(al)ity—and so it was, by the psy-sciences. By the 1900s psychologists had recognized the important role of play in child development. The theories of Piaget, Vygotsky and others emphasized the functional value of play. Play Theorist Sutton-Smith (1997) described how from this early work emerged a rhetoric of play as "play-as-progress"—play as key to child development—which came to be dominant in the 20th Century (and is arguably still dominant today). Sutton-Smith was keen not to dismiss all work in this vein. Yet he was concerned that the rhetoric is problematic when it serves "adult needs rather than the needs of children" (Sutton-Smith, 1997: 42). Today, in advanced capitalist countries, the "adult need" this rhetoric prioritizes is the production of a certain type of "ideal" child/young person and future citizen: possessing certain abilities, self-sustaining, rational, productive and entrepreneurial (Goodley, 2014; Slater, 2015). Even the most cursory of Google searches reveals many online articles and blogs extolling the value of play for preparing children for work and success or explaining how playing games can instil an entrepreneurial mind-set in children.

All children are subject to this rhetoric, but it impacts acutely upon disabled children. Unfortunately, as John and Wheway (2004: 12) comment, too much of the discussion about so-called "freedom to play" for disabled children has in fact "revolved around treatment or directed activity, rather than play". Anxiety that they do not meet the ableist demands of society is revealed in the tests that have been designed to measure their "play dysfunctions" or interventions to enhance their "play performance". Disabled children often spend large amounts of their time undertaking activities that masquerade as play but are really vehicles to help them "overcome" their impairment and achieve certain developmental goals (Goodley and Runswick-Cole, 2010). Play can sometimes be considered to be "frivolous" or "disposable" when the focus of parents or professionals is on educative or therapeutic "regimes" (Beckett et al., 2020). As the British disability activist Micheline Mason (1990) once wrote, reflecting on her own childhood and those of other disabled people:

Other children play, but you do "therapy". (...) Almost every activity of daily living can take on the dimension of trying to make you less like yourself and more like the able-bodied.

The research community continues to play its part in the re(production) of this rhetoric. For example, turning again to the example of nature play—where the play-as-progress rhetoric is highly evident—it is noticeable that its fun/joyful aspects are sometimes downplayed when it comes to disabled children's access to such play. There are studies that suggest that "frivolous" nature play for disabled children distracts from its more serious purpose. Von Benzon (2010, 624), for example, critiques certain UK-based environmental organizations for emphasizing play/recreation and "failing to provide adequate educational opportunities"

for disabled children; whilst Crosbie (2014), in a study of the work of the Calvert Trust (UK) (a provider of outdoor adventure holidays for disabled people, their families and friends) is critical of situations where disabled children are not encouraged to do anything *other than play* because of limiting perceptions of staff or workers. They are, he argues, being denied the wider benefits to be gained from outdoor “education”.

To conclude this section: disabled children do of course have rights to high quality education and rehabilitation. We should be concerned, however, when play is repurposed by adults—*adulterated* (Else and Sturrock, 1998; Hughes, 2012)—to become primarily or solely a vehicle for education or rehabilitation. We should be even more concerned when these activities are about “normalization”. Twisting play to fit adult agendas vitiates it (Eberle, 2014) and can be oppressive. In the final section of this chapter, I consider how we might emancipate play for disabled children from the various barriers to their play, including the “play-as-progress” rhetoric.

## Emancipating play for disabled children

Happily, there is much evidence that disabled children’s play can be liberated from many of the barriers discussed within this chapter. Well-designed playgrounds (Burke, 2013; Moore and Lynch, 2015), improvements to the “journey to play” (e.g., affordable and accessible local transport) (Stafford, 2017), welcoming actions by communities (Burke, 2013), assistive technologies (Chantry and Dunford, 2010) and inclusive design of toys and games (Holt et al., 2014) can help. Professionals such as occupational therapists can support disabled children to achieve their own play goals (Missiuna and Pollock, 1991). Teachers can devise and implement anti-bullying strategies (Good et al., 2011).

Around the world, efforts are being made to challenge disabling barriers and create opportunities for inclusive play. It is increasingly recognized that building a physically accessible playground will not guarantee inclusion of/for disabled children. Imaginative resolutions and approaches are being developed—and are to be celebrated. In Israel, for example, the non-profit Beit Issie Shapiro has built an inclusive playground called Park Chaverim (Friendship Park) and collaborated with Sesame Street (Israel)<sup>9</sup> to develop an educational and social program that aims to raise awareness and help children to learn how to play together. This program includes inclusive get-togethers of families of disabled children and families of non-disabled children, inclusive festivals and visits to the Park by “Sivan”, one of the Sesame Street Muppets. Sivan is a young girl who uses a wheelchair. The model of Park Chaverim has been replicated across Israel and internationally.

### Play for disabled children in Hong Kong and Taiwan

Headline findings of research conducted in 2018. The project involved a survey of parents of disabled children in Hong Kong and Taiwan, exploring their attitudes towards play and perceptions of the barriers to play for their child (see Beckett et al, 2020 for full findings and discussion).

In both locations 98% of parents said that they believed it was ‘important’ or ‘very important’ that their disabled child had opportunity to play. The majority of parents said they preferred inclusive play-spaces (for children of all abilities) for their child: 73.9% (Taiwanese parents) and 88.5% (Hong Kong parents). Parents who preferred ‘segregated’ playgrounds (for disabled children only), tended to say that they believed these playgrounds are safer.

Of the parents who preferred inclusive playgrounds, there were three main justifications provided – inclusive playgrounds:

Enable disabled children to make friends with and enjoy the company of non-disabled children;

Are important for social inclusion;

Help prevent disabled children feeling ‘different’ e.g. a Hong Kong parent commented that she didn’t ‘want to make him feel that he’s a special kid’ and a Taiwanese parent observed ‘the kid has his pride, he doesn’t want to stand out’.

Yet the parents acknowledged barriers to play for their children. The main barriers were the attitudes of other children and adults. 69.8% of Taiwanese and 68.3% of Hong Kong parents said that the ‘negative attitudes or lack of understanding of other children’ were a barrier to their child’s play.

45.3% of Taiwanese and 50% of Hong Kong parents said that the attitudes of adults were also problematic. ‘Free text’ comments from parents relating to attitudinal barriers included that ‘community education’ was needed ‘so that citizens may know and accept’ disabled children (Hong Kong parent) and that ‘empathy’ (Taiwanese parent) ought to be promoted within society.

In the high-density urban populations of both Taiwan and Hong Kong, insufficient space for play in the home was highlighted by parents. Just over 40% of Taiwanese parents and 54.1% of Hong Kong parents said that they were either ‘dissatisfied’ or ‘very dissatisfied’ in this regard.

‘Free text’ comments by Hong Kong parents regarding playgrounds included that ‘places for children’s play are too small and too far away’ and ‘space in parks with sensory play facilities is too small’. A Taiwanese parent observed that ‘most park entrances are gated to prevent scooter riders entering, but it also keeps people with physical disabilities out’.

Parents from both locations reflected on the impact on children and parents of living in societies that prioritise academic achievement. 53.7% of Taiwanese and 52.5% of Hong Kong parents reported that their child plays for less than an hour a day. This was a particular concern amongst Hong Kong parents whose comments included the following:

‘The child has high study pressure. Parents feel troubled. Relationship is affected and so is the child’s self-esteem and self-confidence. Through play, children can release some of the pressure. Hope that the government can adjust the aims of education and let children have real time to play.’

‘Parents and children with learning disabilities are very much troubled by daily homework.’

Over half of respondents (59.1% of Taiwanese parents; 63.9% of Hong Kong parents) stated that they did not have enough time to support their child’s play. Our findings present a picture of time-poverty amongst many mothers, resulting from employment, wider family caring responsibilities, and housework.

<sup>9</sup>See <https://youtu.be/SB5R7R5TZ4I> for a short film about this collaboration. (accessed 19/07/22).

In the Netherlands the Speeltuinbende<sup>10</sup> (The Playground Gang) test the accessibility and inclusivity of playgrounds. The gang is composed of disabled and non-disabled children and is supported by the Dutch Foundation for Disabled Children. The gang visits playgrounds twice—before and after renovation—to assess if the playability has been improved for both disabled and non-disabled children. The gang explore the playgrounds whilst carrying signs. After playing for a while, they come to a verdict on aspects of the playground: either showing the green (positive) or the red (negative) side of their signs. If a playground meets the approval of the Playground Gang, a green sign is erected at the site, which reads “Here we can play well together” (see Fig. 4).

These are but two of many examples of innovative practice facilitating disabled children’s right to play and, importantly, encouraging *inclusive play* between disabled and non-disabled children. In other places in the world there are examples of initiatives designed to enable disabled children’s right to play that operate within (constrained by) existing segregated systems. An example of this is an initiative run by the Rotary Club of Nagpur, India. This club has been working with special schools in the region to run an annual event of sports, games and play activities for disabled children (see Fig. 5 from the 2012 event). The name for the annual event is “Udaan”, which means “flight” and signals, according to the former President of the Club Kapil Bahri, that the event allows the children to “soar above their day-to-day mundane challenges”.<sup>11</sup> Whilst the events may not be inclusive in the sense of bringing together disabled and non-disabled children, they are an indication of progress being made toward recognizing disabled children’s “right to play” and, in their adoption of mixed ability games, these events open the possibility of more inclusive events in the future.

These initiatives, from around the world, are encouraging. Nevertheless, the thorniest barrier to disabled children’s play remains the capacity of the play-as-progress rhetoric to limit disabled children’s access to free play and to repurpose play for their “normalization”. We need to challenge the grand narratives of play that prioritize child development over child wellbeing. Supporting play researchers and practitioners to think critically about the play-as-progress rhetoric and refocus their efforts on matters of play, equity and quality of life, will be essential.

Adults have an important role to play in emancipating play for disabled children. Nevertheless, it is also important to recognize that disabled children are not always passive in the face of processes and practices shaped by the “play-as-progress” rhetoric. We know, from wider research, that disabled children resist disabling discourses and, at times, reconstruct them to fit their experiences and priorities (Priestley, 1998). Research has revealed that disabled children resist processes that seek to govern (“adulterate”) their play, exerting control over and creativity within their play (Burke, 2012). Future play researchers and practitioners concerned with

**Fig. 5** Children take part in the Udaan event 2012 (Rotary Club Nagpur via Flickr CC BY 2.0).

emancipating disabled children’s play might usefully begin by understanding *how* disabled children demonstrate resistance in and through, control over and creativity within their play and then seek to support them in these regards. This section ends with two final vignettes that explore this relationship between play and resistance (Vignettes 4 and 5).

#### Vignettes 4 & 5 Play and Resistance

The next two stories are based upon video-based observational research. The videos were made by a research team based in Portugal. They were exploring whether toy robots might offer augmented manipulation opportunities for children with motor impairments (e.g. cerebral palsy) helping them to engage in independent exploration and participate play activities. The videos were shared with me for secondary analysis (see acknowledgments). In what follows children’s names have been altered to ensure anonymity.

V4: the location is a primary (elementary) school. The setting is a quiet space away from the noise and activity of the main classroom. On a table, a mini-obstacle course has been set up. It looks “fun”. A small robot has been placed at one end of a table. A child, Sofia, sits at the end of the table closest to the robot. Her impairment means that she has difficulties with motor functions.

The researcher, a young woman, gives Sofia instructions about the “game”. She encourages her to use the adapted controls to navigate the robot around the obstacle course.

Sofia looks impassive. Eventually she begins to move the robot. The robot runs over the edge of the table, falling to the floor.

The researcher reassures Sofia not to worry. No harm done. She can have another go. The robot is returned to the starting line. The same thing happens again.

The researcher clearly thinks that Sofia is having some difficulties understanding how the controls work and offers guidance. They try again. Sofia navigates the robot off the side of the table.

The “penny drops” for the researcher—Sofia can use the controls and is intentionally sending the robot over the table edge!

Instead of resetting the scenario and encouraging another attempt with the robot, the researcher asks Sofia “what would you like to be doing?” Sofia says clearly “not this” and indicates she’d prefer to go back to the classroom to be with the other children.

~~~~~

V5: (a different school). A young boy, Martim, is sitting at a computer console. He is a wheelchair user and, like Sofia, his impairment means that he has difficulties with motor function. On the floor in front of him an obstacle course has been laid out. There is a physical perimeter to the course—a set of low barriers. He is using an adapted set of controls to navigate a small robot around the course.

Also present in the room is his teacher and some of his friends. His friends have come to watch and see him demonstrate the robot and his skill with the controls.

The robot begins to move. Instead of advancing around the course, it edges toward the perimeter barrier and speeds up so that it jumps over it.

The teacher quickly picks up the robot and puts it back onto the “official” course. The researchers check that Martim is not having difficulties with the controls.

Again the robot moves. Again it jumps over the barriers. The teacher is clearly frustrated. There is a sense of tension or anxiety, as the adults assume that Martim is not able to control the robot properly and is at risk of exposing some lack of ability to his peers.

They start again. Martim again sends the robot over the barriers. His friends laugh with glee. They have realized, before the adults, that Martim is being mischievous. He is doing this intentionally. An act of resistance appreciated by his peers.

Conclusion

Disabled children, like all children, have the right to play. All disabled children *can* play. Sadly, not all disabled children *do* play. This is worrying. Play has myriad benefits – the most important of which, it is argued here, is that it supports children’s mental health and wellbeing. That said, we must remember that play isn’t all “ha ha hee hee” (to paraphrase the title of Meera Syal’s novel). Play is

a phenomenon exhibiting social structures similar to those of wider life (Henricks, 2006). Oppression and exclusion, including ableism and disablism, can be (re)produced and experienced in play-worlds (Hodge and Runswick-Cole, 2013). Our challenge is to explore how play can be emancipated for disabled children whilst recognizing its ambiguities. Our focus needs to be on play's potential for resistance; for it to be an opportunity for disabled children to take control of their activities; for it to be a vehicle for their creativity and innovation, opening "lines of flight" from normalization (Guattari, 2016). Play, at its best, has the capacity to be a site for "revolutionary effervescence" (Guattari, 2016: 68)—this is why play matters for disabled children, alongside children from all marginalized groups.

I end on a practical note with a set of recommendations. If we are to emancipate play for disabled children, then we need to do the following:

- (1) Recognize disabled children's "right to play"—play free of adult agendas.
- (2) Reject the deficit-model of disabled children's play.
- (3) Challenge the dominance and worst excesses of the "play-as-progress" rhetoric.
- (4) Enhance training for professionals who are in a position to facilitate disabled children's right to play (e.g., play-workers, teachers, occupational therapists), in particular, address the problem of over-protection (which limits disabled children's play experiences) and encourage them to think critically about their own practices (are they prioritizing child development/normalization over child wellbeing?).
- (5) Provide support for parents/guardians so that they are able to resist the play-as-progress' rhetoric, to facilitate their disabled child's free play.
- (6) Acknowledge that even the most well-intentioned initiatives promoting play for all children, may be informed and limited by ableist assumptions, inadvertently excluding disabled children.
- (7) Prioritize inclusion and inclusive methods during the design of toys, games, play-spaces and play opportunities.
- (8) Recognize that inclusion is about much more than physical accessibility: we need to change attitudes (amongst adults and peers) to ensure that disabled children feel included in play.
- (9) Ensure that families are able to access inclusive and affordable toys, play-spaces and play opportunities.

If we achieve 1–9, then we will truly have "come a long way ... "

Acknowledgments

I would like to thank Dr. Pedro Encarnação for sharing the video recordings from which I derived Vignettes 4 and 5. Thank you also to Robin Jerstad for granting me permission to use Fig. 1 in this chapter.

Introduction

Between 2010 and 2012, I was a co-investigator on an Erasmus Plus (Leonardo) project exploring professional partnerships for inclusive education. My role was to attend educational settings across Europe and observe, politely interrogate, and record school approaches to “inclusive” education. On an exceptionally hot, spring day I arrived at the entrance to a school in Reggio Emilia, Italy. It was presented, by teachers and school administrators, as an inclusive school with *minimal* segregation between disabled and non-disabled learners. The contradiction was not lost on me. I was interested to know how the school—inspired by the Reggio Emilia approach to education (Malaguzzi, 1993)—prioritized the inclusive learning and full participation of all learners. We sat at a table in a courtyard; the teachers, sensibly, had taken seats in the shade whereas I, regrettably, positioned my wheelchair in the direct sunlight—with no hat for protection. The teachers spoke, enthusiastically, about developing individual education plans for learners with impairments and diagnostic labels. These plans were open to continuous reassessment and review, justified because learning objectives can be too high and disabled learners can struggle to keep up with the established curriculum. The teachers moved the conversation onto the importance of socializing before I had time to respond. They declared, with pride, that all learners had their meals together. I nodded and asked if “being together” is reflected also in the classroom. There was a pause. “No”, a teacher replied, “disabled students can be part of the classroom for one, 2 h, maybe, sometimes 15 min of an hour, then they work in a separate room. It has computers and better support.” I asked why adopt this approach. A different teacher responded, “Because ... Disabled ... People can be disturbing. You can’t always have disabled children disturbing other kids.” All the teachers, and administrators, nodded in agreement. The response, directed to a researcher with visible impairments, sitting in a power wheelchair, surrounded by assistive technologies and human support, was ironic and all too familiar. Later in the day, sat waiting for an accessible vehicle to collect me from the school, a teacher—acting as a chaperone—stood patiently at my side, tapping their foot to complement the sounds of the agricultural machinery in the nearest field. “Do local disabled activists influence your school’s approach to learning? Do they assist in supporting your students to have a voice in organizing the school?” I asked. The teacher shook her head, “No. No activists are here.”

The narrative above reflects a central thread in this chapter. It is interesting to consider to what extent disability activism would influence the production of inclusive educational arrangements. Disability activism remained absent in the local context outlined above. Education, here, was predicated on a tolerance for exclusion (Slee, 2019). Disabled people positioned as deviant, disruptive, and problematic to the ordering of school learning were a hindrance and threat to other people’s educational pursuit. Although unlikely to address the entirety of restrictions, exclusionary practices, and prejudiced attitudes experienced by disabled learners, activism has the potential to destabilize current educational configurations and introduce alternative, arguably preferable, possibilities for organizing education. The role of disability activism is integral to the conceptualization of inclusive education, as well as resisting the exclusionary practices and policies that permeate educational environments.

The chapter explores how young disabled activists conceptualize inclusion, as well as the practices they employ to pursue inclusive and emancipatory agendas. This is explored within the context of education, and consideration is given to how disability activism complements the pursuit for inclusive education. The next section, following this introduction, explores and critiques young disabled activist’s conceptualization of inclusive education with a particular focus on two specific aspects. Firstly, the purpose of inclusive education and, secondly, the significance of disabled people’s participation in education environments and knowledge exchanges. The chapter then considers the possibilities and opportunities for inclusive education and disability youth activism to coalesce, with particular attention on recognizing the importance of young disabled people’s ideas and perspectives within the production of inclusive educational arrangements. This chapter draws on literature investigating young disabled people’s participation in disability activism and social movements (Griffiths, 2022).

The conceptualization of inclusive education explored in this chapter recognizes disability as a social justice issue. The chapter’s central argument is that inclusive education approaches must facilitate young disabled people’s participation within activism and social movements. Inclusive education has the potential to support young disabled people to determine disability as political, and to contribute to the claims and activities to realize emancipation. Inclusive education can, and should, produce accessible

and participatory knowledge exchanges for young disabled people to become aware of disability politics and the injustices that emerge because of how society is organized. Education serves as an opportunity to reflect the principles of inclusion, justice, fairness, and participation within and beyond education. Disability youth activism provides routes to disrupt exclusionary education policies and contributes to the realization of inclusive education. To achieve such disruption, and introduce possibilities for progressive change, consideration is needed to ensure young disabled people have accessible opportunities to influence the organization of education.

Understanding disability, in this chapter, draws upon the social model of disability. The social model is key to the development of disability activism in the UK. The principles, which underpin the model, articulate disability as a product of social conditions, imposed upon people with impairments. This creates unnecessary isolation and exclusion for disabled people, who remain an oppressed group due to how society is organized (UPIAS, 1975). The model remains influential in academia, notably within Disability Studies (Owens, 2015). Activism, in this chapter, draws on Tilly and Tarrow's (2015) definition of social movements and the contentious politics that emerge through activist relations. Contentious politics refers to the relations that exist between and beyond activists, who are engaged in asserting and maintaining claims for social change. On a broader scale, social movements constitute: (a) repeated attempts of claim making; (b) strategies to disseminate claims publicly; (c) maintaining collective solidarity; and (d) resource mobilization to sustain claim making and their related activities.

Conceptualizing inclusive education through disability youth activism

The discourse that surrounds conceptualizing education is replete with tensions over who is considered an acceptable presence within the educational environment (Miles and Singal, 2010). This means the debates and aspirations to determine how learning should be facilitated, how school should be organized, and why knowledge should be exchanged, often reject, restrict, or excuse the participation of disabled learners (Byrne, 2022). Discussions about disabled people's inclusion in education become relegated to the technical details surrounding an integrative approach to educational provision (Oliver and Barnes, 2010). This, ultimately, distracts from establishing a broader narrative as to how education ought to be organized—particularly—from the perspective of those who experience daily injustices in the pursuit of learning. In this section, attention is given to how disability youth activism can produce insight into the purpose of inclusive education, as well as the dynamics of participation within learning environments.

It is possible, through exploring young disabled activists' accounts of inclusion, to learn from and centralize their ideas to belong, participate, and resist within educational arrangements. In Griffiths' (2019) study of UK disability youth activism, the premise of inclusion constituted four principles. Firstly, developing a sense of pride and acceptance across all identities. Young disabled activists argued that inclusion requires embracing and celebrating all variance and diversity within existence. It remained paramount that individuals, and collectives, are encouraged and supported to articulate their identities; and that a sense of pride is produced and maintained throughout the environment. This reflects the importance of an affirmative identity, wherein impairment is not assumed to be tragic and disabled people are not objectified through a lens of pity, sorrow, and tragedy (Swain and French, 2000).

Secondly, progressing rights to realize positive and negative freedoms. Here, the premise of rights is used to further the full participation of disabled people and remove infringements that would, typically, deny disabled people a valued and respected presence in their communities. Young disabled activists argued for rights to produce mechanisms and interventions that would facilitate disabled people's engagement in education, such as the right to access support and the right to participate in educational settings. Alongside this was the application of rights to remove forms of interference that would deny or impede disabled people's participation in education. Hirschmann (2016) argues for a freedom approach to rights to realize inclusive and socially just societies. This, they argue, establishes a basis that disabled persons are free, equal human beings who cannot be denied their status as rights-bearers.

Thirdly, reconfigure the political and economic conditions that produce marginalization and oppression. Young disabled activists emphasized the necessity to identify and challenge the political and economic arrangements that (re)produce restrictions experienced by the disabled people's community. This reinforces a central tenant within disability politics, which is to understand disabled people's marginalization as a result of historical and contemporary social world organization (Lawson and Beckett, 2021). The neoliberal influence upon education is well documented (Roda, 2017; Hedegaard-Soerensen and Grumloese, 2020; Ball and Grimaldi, 2021), particularly within the context of disability (Liasidou, 2015; Kearl, 2019). Strategies for developing fair and socially just societies must incorporate an assessment of the political and economic influences on communities (Graeber, 2009).

The final principle is to build sustainable campaigns to maintain dialog and activities focusing on realizing inclusive societies. Here, young disabled activists insisted on configuring campaigns and agendas that would promote, continuously, the importance of inclusion and emancipation. This was an attempt to recognize the ongoing imperative to promote claims for realizing inclusive societies, and to never assume inclusion will be realized or maintained without constant vigilance and action. The perpetual need to contest injustices, and promote claims for inclusion, is an attempt to keep the importance of inclusion at the forefront when it comes to organizing education. It requires strategies to highlight why, and how, inclusion is necessary; however, it also illustrates that inclusion can often be reversed or dismantled (Peruzzo, 2020). Building campaigns to promote inclusion are—to some extent—a response to Schmitt's (2003) argument that processes of alienation lead people to accept, and advocate for, conformity.

Accepting conformity limits the possibilities of reorganizing spaces, producing alternative possibilities, and resisting the arrangements that produce unjust and inaccessible societies.

These four principles highlight the practices that are required to realize, and sustain, inclusive environments. They encompass arrangements associated with traditional, albeit structural, understandings of social world organization (Oliver and Barnes, 2012). They also engage in the (re)claiming of the subjective experiences of disability, contesting the categories produced to define disabled people and their position in society (Feely, 2016). There are consistent attempts to disrupt and rework existing arrangements (political, economic, and legislative) to realize inclusive education, as well as introduce new strategies and resistance practices to promote and celebrate disabled people's identities and their participation in education. These principles are evident of radical and incremental pathways to realize inclusion. Young disabled activists are establishing approaches that allow for flexibility and creativity in the pursuit of their goals, instead of adopting an either/or approach.

Promoting flexibility and creativity can be read as a response to the existing struggles in inclusive education literature. Understanding inclusion can become trapped in irresolvable debates about the purity of definitions of inclusive education and precise and binding blueprints for building educational institutions (Slee and Allan, 2001). The principles outlined by young disabled activists should be read as options for experimental play: things to work through, embed, and test within educational environments. Building pedagogical approaches to explore, promote, and celebrate disability pride is one option. So too is an approach that explores how learning opportunities, critical thinking, and knowledge exchanges can be protected by utilizing existing legislative infrastructures and calling for further radical alternatives. Inclusion, here, necessitates an exploration of the dangers and implications of current and emerging educational practice. It attempts to unsettle the existing arrangements that constitute education while, simultaneously, offering disabled learners an influential position to produce new ways of thinking about disability, education, inclusion, and participation.

There are similarities between the principles proposed by young disabled activists and the definitions of social justice education employed by Zion and Blanchett (2017). Their approach is to consider the extensive forms of social exclusion that are tolerated throughout social organization, and which are reflected in the production of schools. Equitable access to education does not exist for disabled students and leaves them struggling to engage in a learning environment, and curriculum, that gives little attention to the significance of social justice. Inclusive education requires a commitment to embed a social justice critique across all educational arrangements. This, it is argued by Zion and Blanchett (2017), will encourage a re-examination of the purpose of education, a reconfiguration of the curriculum, and a review of how education is situated across political, economic, cultural, and social arrangements in society.

The significance of social justice education is found within the broader discourses surrounding school organization. deMarrais and LeCompte (1999) and Spring (2013) highlight an egalitarian imperative within education, which attempts to position educational practice as a regulator of opportunity. It is designed to produce and promote opportunities for social mobility, improved quality-of-life, and sustainable community development (Adebayo, 2020). There are also humanistic and civic imperatives, which aim to position education as a right. The right to access education is coupled with responsibilities and duties, imposed upon the learner, to utilize their education to better society (Blais and Labbé-St-Vincent, 2011). The humanistic and civic imperatives are centered upon a notion of preparing learners to reciprocate and give back to their respective communities. This also mirrors the expectations found within the economic imperative of education. Learners are expected to develop skills, competencies, and attributes necessary for engaging within the existing economic model (Merrill-Glover and Edwards, 2015). Their education is predicated on participating within the labor market and contributing to economic output. Social justice, in this regard, is about broadening participation for communities to access and remain in the labor market.

The imperatives outlined above utilize social justice to widen learner opportunities to access education, embed responsibility and civic duty within the student, and prepare them for contributing to existing economic arrangements. These approaches to social justice must be read alongside the continuation of practices to categorize learner abilities (Kilinc, 2019), standardize pedagogical approaches (Molbaek, 2018), and legitimize certain knowledge exchanges over others (Mølsted et al., 2017). Scholars have highlighted how inclusive education practice undermines the principles of inclusion and social justice (Armstrong et al., 2010; Slee, 2018); however, the absence of a disability politics critique is of relevance here.

It is important to analyze, by returning to the principles of inclusion as articulated by young disabled activists, how broader conceptualizations of social justice and inclusion disregard the nuances found within disabled people's experience. Inclusion and social justice, within education, rarely equips a disability politics critique to contest the contradictions and controversies found within existing education policy. There is a lack of empirical data, and literature, exploring the importance of disability politics within curriculums. This has implications for the production of disabled people's political identities, and the associated pride and celebration of disabled people's participation across educational institutions. It can also lead to a weakened or non-existent interrogation of the arrangements that reproduce normative and ableist (Wolbring, 2008) values throughout society—including in schools, colleges, and universities.

This can be reversed and the ideas, perspectives, and activities of disability youth activism, can be incorporated into education design, development, and delivery. Beckett's (2013) research with school-aged children identified non-disabled learners sustaining a privileged, and perceived superior, position over disabled people. Such findings illustrate that current pedagogy fails to challenge conceptualizations of disabled people as tragic, problematic, and deviant. Action is required to cement anti-oppressive pedagogies, which will disrupt contemporary understandings of disability and situate learning within social justice, inclusion, and emancipation. Beckett (2015) offers a typology of anti-oppressive pedagogies to envisage how teaching and learning could identify the arrangements, practices, and ideas that reproduce disabled people's marginalization and oppression. This is necessary for realizing

innovative forms of inclusive education, which—in turn—supports the organization of socially just, democratic, and accessible societies (Slee, 2011). The typology is influenced by the work of Kumashiro (2002) and sets out three approaches to anti-oppressive pedagogy.

The first pedagogy is centered upon the interrogation of *othering*, which often situates disabled people as a threat to the normative expectations of how one ought to be, become, and exist. To disrupt this, knowledge is centered upon the development of strategies to identify, and eradicate, stigma and prejudice toward disabled people. It attempts to celebrate difference and encourage acceptance in the various ways people live and participate in their communities. Beckett (2015) argues that this approach is useful for severing the link between impairment and deviancy. The second pedagogy examines the social arrangements that reproduce continuous patterns of inequality, social injustice, and disadvantage. It supports students to understand the relations of power that emerge, coalesce, and diffuse throughout society (Jerome and Lalor, 2020). This is useful for student cohorts to build consciousness about power, resistance, and the necessity to destabilize political, economic, social, and cultural arrangements that maintain oppressive conditions (Freire, 2000). Student activities are centered upon critiquing contemporary structures and arrangements that remain detrimental to disabled people's inclusion. Finally, the third pedagogy is associated with producing knowledge exchanges for the purpose of reimagining spaces, relations, and categories. Beckett (2015, p. 84) promotes this pedagogy as a way for learners to "think otherwise." Teaching and learning, here, is not to impose one perspective over another; instead, it is to provide learners with the techniques and opportunities to question how the social world is organized and to introduce alternative possibilities—a plurality of futures (Motta, 2013). This is pertinent for questioning how, and why, disabled people are positioned in precarious, violent, and restrictive conditions. It also guides learning toward imagining new, alternative, forms of disabled people's participation and existence (Obourn, 2020).

There is complementarity between the views expressed by young disabled activists and the three pedagogies. Young disabled activists outlined, in their articulation of what constitutes inclusive practice, the importance of disability pride and the disruptive potential of celebrating disabled people's political identities. Embracing disability pride leads to respecting human variance and diversity (Martin, 2012), and has the potential for destabilizing processes of internalized oppression (Watermeyer and Görgens, 2014). Disability pride becomes a tool to disrupt notions of normality, conformity, and the value imparted upon specific attributes, traits, and characteristics. Through challenging stereotypes and prejudice, learning environments can be experimental spaces to redefine identities, resist discrimination, and articulate possible and preferable futures (Lorde, 1990). Emphasis is also placed on critiquing the political and economic conditions that exacerbate disabled people's marginalization. Young disabled activists call for inclusive practices to illustrate how existing social conditions reproduce unnecessary restrictions for disabled people. This reinforces Erevelles' (2000) claim for knowledge exchanges to critically engage with the inter-relationality of political, economic, and social structures for the purposes of understanding struggle and suffering. Learning, in this approach, opens possibilities for analyzing the significance of activism and disabled people's social movements. It encourages an exploration of rights-based approaches (Blanck, 2005), incremental policy measures (Harris and Roulstone, 2011), and radical claims (Withers et al., 2019) for social world overhaul. Young disabled activists also highlighted the importance of ongoing campaigns, and resistance practices, to maintain focus on producing inclusive practices. This could be read as a call for inclusive education to carve out safe and accessible spaces to critique, ponder, and propose alternative ways of organizing societies. It is to, as Beckett (2015, p. 84) suggests, "devise new (positive and non-oppressive) ways of thinking and acting about [oneself] and others; experiment with what and where a life can be/do/go."

The chapter now considers potential avenues for fostering sustainable and effective relations between disability youth activism and inclusive educational practice.

Embedding disability youth activism within inclusive education

Florian and Black Hawkins (2011) illustrate how inclusive pedagogy discourse often positions inclusivity as a process of reformatting curriculum and teaching practices to accommodate all learners. This is a flawed approach to understanding inclusive education. Instead, inclusive education can be informed by disability youth activism to progress learning and activities on an inclusive space, why it is necessary for social organization, and how emancipatory claims can be realized. The pursuit for inclusive education should consider young disabled people's desire to influence existing educational arrangements and practices. There are three issues to consider if the ideas, and practices, of disability youth activism is to inform inclusive education: problematic conceptualizations of youth; embedding notions of futures in curricula; and establishing spaces for disability activism to flourish within educational practice.

Conceptualizations of youth can restrict young people's participation within the design, organization, and delivery of projects and strategies (Müller-Bachmann et al., 2022). This is because children and young people are perceived as passive future beings, unable to absorb the nuanced arguments and commentaries expressed by authoritative and influential individuals and groups (Jenks, 2005). Research carried out by Slater (2015) highlighted that young people—in contemporary Western discourses—are often positioned as incomplete adults. They are deemed to not possess the attributes, characteristics, and values necessary for interrogating complex issues and providing solutions. Ascribing an incomplete status indicates that credibility, insight, and influence can be attained only after young people have transitioned through the border zones of youthhood. Alldred and David (2007) suggest this relegates young people to be understood as responsible people-in-waiting.

Having intuitive ideas, and the responsibility to coordinate activities, are understood as possessions—things to have after one has become an adult. They are not available to children and young people, or they are restricted to specific purposes and contexts. Young disabled people, within the context of UK disability activism, struggle to contribute and influence emancipatory agendas, strategies, and demands. Research findings (Todd et al., 2012; Griffiths, 2019) indicate that young disabled people are primarily involved in discussions and topics that require a dedicated youth perspective. This restricts their contributions to occasions that are focused on youth solely; it denies young people opportunities to engage within the discourses and practices beyond youth issues. Their narratives and commentaries are considered irrelevant, naïve, and ineffective if youth experiences are not of concern. The reluctance to facilitate broader youth participation, particularly beyond youth matters, can lead to situations where adults are required to validate and confirm youth perspectives. Slater (2015) suggests this is portrayed as adult generations who believe it is their responsibility to take control and enlighten children and young people.

Education configurations are likely to reflect these dominant conceptualizations of youth, which will lead to young people becoming occupied with learning about—and embodying—specific traits and abilities as they progress toward adulthood. For Kelly (2011, p. 48), youth participation is often understood as “becoming an adult, becoming a citizen, becoming independent, becoming autonomous, becoming mature and becoming responsible.” Minimal regard will be given to young disabled people's contributions if such understandings are not challenged. There is a danger that young disabled people will not be presented with opportunities to inform and influence the organization of inclusive education. They will not be supported to share their experiences, interests, and ideas associated with activism and politics, and contextualize these within the broader aims of producing inclusive knowledge exchanges.

A refreshed approach to participation is required if disability youth activism is to inform and influence inclusive education. Cahill and Dadvand (2018) propose a framework that, simultaneously, disrupts existing expectations of young people's contributions and encourages new forms of active engagement. Their approach is to understand youth perspectives as an assemblage of interactive ideas and activities, which come together to form new possibilities to experiment with and pathways to follow. Youth, here, is understood as a manifestation of experiences located within space, time, and relations (Dadvand, 2018). It denotes the circumstances, relationships, and situations encountered by young people, which are rooted within the current political, economic, social, and cultural arrangements. It is essential that young disabled people are recognized as active, and valued, participators in the organization of education. Their contributions—in the present—are significant for reconfiguring spaces and promoting inclusive remedies to current injustices (White et al., 2017).

Disrupting contemporary conceptualizations of youth is essential for valuing—and promoting—young disabled people's contributions; however, an additional issue needs addressing. Curricula need to be organized to encourage, and facilitate, discussions about realizing inclusive societies. This, in turn, will impact the organization of educational institutions. Young people's commentaries on the future tend to be framed as individualized narratives, focused primarily on personal achievement and success (Facer, 2011). It is argued this is due to perceptions of the future being colonized by neoliberal economic events, corporate agendas, and consumerist ideals. Aspirations become fixated on individual competitiveness (Naidoo, 2018), self-sufficiency (Giroux, 2009), and a disregard for collective progression (Peters and Marshall, 1996). This results in a precarious situation. On the one hand, exploration of futures is tolerated within pedagogy if aligned with notions of individual gain and personal success. Alternatively, little emphasis is placed on building knowledge exchanges and learning environments to consider possible, and preferable, inclusive societies for all.

Hicks (2002) argues for educational establishments to present safe, and accessible, spaces for learners to consider the plurality of futures available for exploration. This provides a platform for students to develop analytical skills and criticality, both useful for reflecting on potential futures (Facer, 2013). Learners should be supported to critique the present arrangements that constitute the social world, and determine the conditions necessary for realizing inclusive communities. This means questioning the attempts made by those who “know” the future then to consider the possibilities that may come to exist in a social world where the future is unknown—or open to alternative possibilities. Attention should be paid to the way or ways in which the emergence of ideas about the future will initiate action in the present.

While people are unable to know the future, this allows for creative opportunities to consider what may be possible (Miller, 2011). Disability activism and politics can serve to disrupt the tendency to individualize future narratives, instead shifting the focus to collective pursuits for progressive social change. Pedagogical practice, which absorbs the ideas of disability youth activism, positions learners at the forefront of generating ideas for transforming society. Their role is to understand contemporary and potential crises, with consideration given to the various responses available to address such catastrophes (Hicks, 2004; Inayatullah, 2008). A focus on the future also prompts learners to proactively consider how the social world ought to be organized (Masini, 2011). Learners can use future orientated curricula to propose how people should be supported to live, thrive, and participate in their communities. It can allow for new visions of welfare, security, and assistance.

In addition, it is rejection of the fatalistic predictions often attributed to discourses about the future (Davidson, 2019). Discussions about the future should not be primarily focused on responding to immediate concerns and reacting to the ongoing injustices encountered by marginalized communities. Notwithstanding the importance of addressing immediate injustices, the risk is that considerations of the future become fixated on short-term, crisis driven agendas. Inclusive education can become a space to introduce contingency within the present and destabilize the preferred narratives and trajectories established by existing influential forces. To achieve this, dedicated spaces within education are required to facilitate disability activism participation.

There is a need to establish spaces for disability activism to flourish within educational practice. Participation within activism remains patchy for young people from marginalized communities, particularly at the school level (Andrews, 2009). This points

to a continued absence of learners who will be excluded from emancipatory politics, given the struggles of young disabled people to participate in disability activism (Griffiths, 2019). Educational environments need to establish accessible pathways for young disabled people to learn about disability politics, and to build connections between existing activist networks, disabled people's organizations, and learners. Inclusive education needs to provide opportunities for young disabled people to become activists, as well as encourage young disabled people to use activism to influence education arrangements. To achieve this, inclusive education must be organized around three facets.

Firstly, educators will need to be familiar with the complex demands, agendas, and strategies employed by disabled activists and social movements to realize disabled people's inclusion. This requires translating the historical, and contemporary, ideas and practices that comprise disability politics (Berghs et al., 2019; Soldatic and Johnson, 2020) and ensure it is accessible and stimulating to learners—many of which will be newcomers to disability activism. Much of the archived material about disability activism is retained within higher education establishments (Griffiths, 2019), which remains inaccessible to disabled people (Brown and Leigh, 2020). Learners will need to be supported to reflect on the existing collections and materials and consider how activist claims redefine their own lived experiences of disablement and social injustice (Moore and Pell, 2010).

Secondly, educators will need to support learners to create and experiment with disability activism claim-making. For Braa and Callero (2006), the use of classroom discussions is an effective method for assisting students to engage in activism and social movements. Young disabled students can participate in discursive exercises to determine the possibilities for progressing inclusion and accessibility. This is important for ensuring learners can relate to—and influence—concepts and issues relevant to their lives (McCabe, 2013). The dominant claims made within disability activism and social movement organizations need to be contested by students, either through discussions or by embarking on activist orientated projects and collaborations.

Finally, educators need to situate this exploration of disability youth activism within the parameters of building inclusive education spaces. Isin (2008, p. 38) refers to activists "engage[ing] in writing scripts and creating the scene" for social change. In a similar vein, young disabled activists, within educational environments, should localize their interest in disability youth activism to assert claims and positions pertinent to the realization of inclusive education. This may require measures such as establishing specific student-led governance structures (Dollinger and Vanderlelie, 2019), representation of young disabled activists within education policy making processes (Deutschmann, 2022), and an expansion of advocacy provision within education settings (Thomas et al., 2017). The strategies have the potential to increase young disabled people's participation in activist mobilizations, as well as cement disability activism's role in eradicating discretionary practices within education.

Conclusion

This chapter has interrogated two aspects of inclusive education. Firstly, it has explored conceptualizations of inclusive education and aligned it with contemporary accounts of inclusion by young disabled activists. Secondly, it has considered how the organization of education can be informed by disability youth activism and politics. The chapter argues that inclusive education must comprise of persistent interrogations as to what constitutes inclusive and accessible societies, which should be informed by the ideas and activities of existing young disabled activists and newcomers to disability activism. It is paramount that inclusive education critically engages with the resistance practices of young disabled people, across the spectrum of incremental and radical activity, to understand and celebrate how disabled people are reconfiguring the social world. This will introduce opportunities for all learners to consider and experiment with alternative futures—to introduce contingency, possibility, and change into the worlds we are to inhabit.

Inclusive education has the potential to be guided by principles of disability youth activism and achieve two specific outcomes. Firstly, it can provide a continuous space for exchanging knowledge on what constitutes—and should constitute—inclusion and how this is reflected in social world organization. Secondly, it can utilize disability and disabled people's experiences to interrogate how human variance and diversity is celebrated, disregarded, and oppressed across societies. Education and knowledge exchanges should be orientated toward supporting creativity, exploration, and experimentation of how communities can be organized and participation for all guaranteed.

Introduction

There is a lengthy history and longstanding fascination with attitudes of presently non-disabled people toward those living with disabilities (Antonak and Livneh, 1988). Traditionally this manifests in attempts to reify, identify and measure the psychological construct. No cohort is left unchecked as the research moves through groups to capture these attitudes—from school principals to teachers generally, to history teachers, to mathematics teachers, to science teachers, and so on. The work extends to teaching assistants, student teachers and school ancillary staff and moves across sectors from early childhood to primary and secondary school, vocational and higher education. Comparisons are also made between education workers, health workers, criminal justice workers and beyond. It is important to acknowledge the sheer volume of this research makes it difficult to resist generalization. This chapter is not intended to be a literature review yet it is important to acknowledge volume and activity for research into attitudes are regularly set free from contingency, devoid of context and reliant on dominant forms of reductionist psychology.

There is inference in this work that once the character and the carriers of so-called negative attitudes toward disabled people are identified, these thoughts can be mitigated through adjustments to teacher preparation and professional development. Also common to the cannon is scant recognition of ontological and epistemological traditions generative of two sustaining features in this work: psychological reductionism and ableism. Researchers generally eschew acknowledgment of their ontological footings and more will be said to this point below. Preempting the forthcoming argument, descriptors such as disabled and non-disabled are struck as stable categories. The effect being at least forty years of research espousing similarly essentialized ontology, research design and repetitive recommendation that these things called attitudes exist, are deleterious toward people living with disability and therefore must be changed.

This chapter thinks otherwise about attitudes and how they might be known. To begin, how might we ask researchers to become interlocutors within the psychosocial, political and material world they inhabit? As an initial step, this is a call for analyses regarding commencement; with apriori assumptions and orientations that too predictably lead research to foregone conclusions. The following discussion begins with consideration for how we categorize disability in educational contexts. I then turn to consider how attitudes have been operationalized in research after-the-fact. While not denying the impact of prejudices enacted in and sustained by ableist attitudes, the chapter points to a research opportunity which, if taken seriously, heralds the outlandish—a call for dissolving inclusion.

Attitudes about disability

In this section my intent is to show how researchers, when orienting to the world, enact different ways of knowing/being (Corcoran, 2017a). Much of the research that aims to identify attitudes of non-disabled people to disabled students can be connected to conservative and neo-conservative traditions. Special education, whether in its more established form (e.g., Fuchs and Fuchs, 1994; Kauffman and Hallahan, 1995; Kauffman and Sasso, 2006) or neo-conservative manifestation (Farrell, 2006; Hornby, 2014), proceeds from what scholars in the field of Disability Studies call a medical model of impairment (Goodley, 2017; Oliver, 1990, 2009; Thomas, 2004, 2007). There, disability is understood as a representation of individual pathological defectiveness that presents for diagnosis, intervention, treatment and management. Consequently, there is little question disability exists and it is of the individual—an affliction that can evoke fear, pity, charity, or professional interventions to normalize the disabled individual.

Disability Studies however proceed from divergent ontological assumptions. As socially constituted phenomenon, disability is engaged as ubiquitous, dynamic and understood as the consequence of social (i.e., institutional, political and cultural) responses to people's impairments, illnesses and/or differences. Accordingly, disability is not of the pathology of individual people but more precisely an expression of social or political mores sustaining the oppression of those described as disabled. As a developing field within the social sciences, Disability Studies is being shaped by researchers and activists from a range of theoretical traditions including critical theory, post structuralism, feminist studies, critical race theory, queer studies and crip studies.

The focus for the education scholar committed to inclusion, proceeding from divergent points of engagement, might narrow to questions about how students are brought into being as different in and through entangled life flows.

When you've seen beyond yourself

then you may find peace of mind is waiting there

And the time will come when you see we're all one

And life flows on within you and without you

Harrison (1967).

In 2017 the world celebrated the 50th anniversary of the release of The Beatles *Sgt. Pepper's Lonely Hearts Club Band*. I need not add more to the volume already written about the band and their landmark recording. Suffice to say the relevance of George Harrison's lyric to this discussion is simple: it speaks to a kind of onto-epistemological union often discounted and derided as unchecked hippy-inspired spirituality. It makes complete sense for people philosophically and materially invested in ideological individualism to say as much. The advent of modern psychology has dutifully helped to perpetuate self-focused proclamations on what is thought to exist within, that being our psychology and its constitutive elements (e.g., psychopathologies or disorders). How might we then understand life otherwise when the majority of talk about human being is premised on reductionist principles?

Below I offer an alternative by conceptually reconsidering attitudes as psychosocial phenomena or "life flows" to borrow Harrison's phrase. I believe, in reconsidering life's enactments this way, more ethical and purposeful opportunities might be cast in educational research and practice. Along the way, questions involving research relations, production and enactment shuffle forward, anticipating certain ways of life (cf. Wittgenstein, 1953). There is indeed a different set of ethical tensions to be considered when surveying or interviewing presently non-disabled people about attitudes regarding students living with disability. As well as ethical tensions revolving around disability categorizations and subsequent tendencies to frame students as a problem for the school rather than the school as a problem for the student, these things called attitudes remain stubbornly affixed and seemingly difficult to remove from the heads of individuals.

Psychology of attitudes

As a first move, retracing a course through history can often be insightful. When it comes to historical accounts of psychology, there are few more informative than those provided by Kurt Danziger (1990, 1997). In *Naming the Mind*, Danziger supplies erudite coverage of many of psychology's key concepts including intelligence, motivation, behavior and attitudes. Regarding attitudes, it is unsurprising that understandings of the concept have changed over the years. Psychology's infancy as a distinct scientific discipline saw researchers take up interest with psychological phenomena as observable via instances of motor function (i.e., muscle movement). For example, it has been suggested a person's facial expression may be considered the overt expression of underlying emotion. Still today psychologists research the evolutionary and universal nature of facial expression and its correlates to emotion (e.g., Ekman, 1973, 2003). If researchers could infer an emotional state from physical observation, what other kind of psychological phenomena might be addressed?

The shift to researching attitudes was initiated over a century ago. The dominance of experimentalism in the new social sciences encouraged work that empirically connected observable actions with the internal psychology of the individual. Theory had already started to explain the potential existence of attitudes (Titchener, 1909). It was suggested if a means to measuring attitudes could be developed, the existence of mental constructs would be confirmed. To establish its scientific bonafides, psychologists would need to go further than simply canvassing people's opinions. Political polling and advertising market research was already sourcing opinion from the general populace by the early 1900s. The social scientific challenge was to create a method for exposing attitudes via sophisticated measurement and in so doing, a logical cause of behavior would be made.

Any social science researcher worth their salt has heard the name Likert. Renis Likert was a student of Louis Thurstone, an American psychologist acclaimed with pioneering key developments in the field of psychometrics. It was Thurstone who proposed the law of comparative judgment, a central principle used in measuring psychological constructs like attitudes. Thurstone's work allowed researchers to scale measurement via a method of pairwise comparison. His research helped transfer work in the area of psychophysical judgment (e.g., comparing material objects on a physical dimension like weight) to judgments sought on social positioning (e.g., being pro- or anti-a particular topic). In 1932, Likert coopted Thurstone's approach to provide what those familiar with questionnaire or survey research today know as a cornerstone of such method, the Likert scale. This is commonly a 5 or 7 point

ordinal scale respondents use to judge where they are situated in relation to a particular statement. When a series of statements or items sufficiently correlate, the scale is deemed significant.

An issue often not addressed in understanding measurements such as attitude scaling is a slight of hand employed in its early development (Danziger, 1997). What had been an intra-individual method involving psychophysical judgment (i.e., one person making a series of judgments) was subsequently and unproblematically applied as an inter-individual method (i.e., pooling judgments from more than one person). Such a move neglects and negates the capacity for individuals to develop different meanings from particular words or statements. As briefly discussed above and in our present context, who is to say we agree on what the term disability can mean? Also, as an ordinal scale, the difference between a response of “often” and a response of “sometimes” is not measurably exact. Subsequently, what any response means to one individual is not necessarily the same for all.

Despite such conjecture, attitude research accelerated from the Second World War on. The technology found traction with government services, particularly in the US, proliferated by social scientists serving in the US War Department’s Information and Education Division. Psychologists “held that attitudes actually exist as the mental property of individuals, not groups [and] claimed that their focus was on external, observable behavior; yet attitudes clearly are concerned with internal characteristics. This contradiction precipitated years of debate about the link between attitudes and behavior” (Walsh et al., 2014, p. 290). Such controversy persists today as policy makers and researchers struggle to change behavior via focus on attitudes (e.g., Ewert et al., 2021).

This brief incursion into the history of attitude research brings to the fore two central concerns. The first is to do with the theoretical treatment of attitudes as causal psychological phenomena. The second points to methodological issues created when language is treated as a neutral conduit. Together, these raise distressing problems that cannot be overcome by simple reconfiguration of existing cycles of knowing/being. And so, it is to an onto-epistemological envisaging that we now turn. In the following section discussion invites a different way of considering attitudes as psychosocial phenomena.

Attitudes as life flows

It is this kind of knowledge—of the provisions and resources we make available to ourselves for the realisation of our different possible next forms of social behavior—that is the special kind of knowledge embodied in the world of civil society

Shotter (1993, p. 3).

It is easy to get caught up with/in words. Ontology. Epistemology. Onto-epistemology. More and more, terms like these seem to make their presence felt in contemporary social science discussion. Even if you experience their use as frustrating, this is, I believe, a good thing. It is, as Shotter intimates above, necessary for us to examine both ways we go about knowing (epistemology) and existing forms of life (ontology) supported in/through such work. Rather than being made to accept life in/on certain terms, such discussion opens ethical debate around how life could and should be. The discomfort experienced in grappling with the lexicon slowly gives way to a kind of freedom wherein language has the potential to become more servant than master. In this section I dissect further the provisions and resources made available in attitudes research to clear a way for what could possibly come next.

The kind of attitude research discussed here predominantly belongs to a monologic view of life. It is monologic in that it generally stories disability through two mutually supportive philosophical perspectives, realism and positivism. We need not go into extended discussion regarding these. Suffice to say, the kinds of provisions and resources made available in such work do more to disable possibilities than enable change. Let us resume the discussion broached in the previous section regarding what we believe to be ontological and epistemological oddities promoted by the majority of attitude research to explain this further.

Ontologically, attitude research promotes, unsurprisingly, psychologism (Sugarman, 2017). This comes about when psychological perspectives are deemed fundamental to the account rendered. Attitude researchers do this by accepting and promoting the existence of individually possessed mental constructs verified through measurement. My main apprehension with attitudes explained as mental constructs is the division created between a corporeally situated psychological interior of the individual and an existent exterior where the rest of life takes place; in homes, in schools, in communities and so on. Seemingly, if people could just change the way they think about disability or education, what goes on in schools and in classrooms should follow suit. It could be suggested that today fewer people are willing to accept this kind of psychological dualism and yet, such ontological reasoning persists (e.g., Krischler and Pit-ten Cate, 2019). When the prevailing contemporary ideology is that of individualism, it is fair to ask how could it be any other way?

Subsequently, this reductive view of existence is supported by a way of knowing the world in which certainty is both promised and believed. The gold standard, particularly for those claiming to be scientists, and more fervently for policy-makers these days, is evidence supposedly guaranteed by experimentalism. This kind of proof, derived from statistical inference, aims to generalize what are often called research “findings.” A simple way to check what is being presented is to ask whether the outputs of research are claimed to be found or made (Corcoran, 2017b; Shotter, 1993). With the former, there is a legitimated separation of epistemology from ontology or knowing from being. Put directly, what is presumed to exist (e.g., attitudes) are waiting in the world to be found. If we are yet to find them, this does not necessarily mean we should doubt their existence. Because ontology can be separated from epistemology, verification of a certain reality may simply be pending the appropriate method for knowing.

But what if we were to consider attitudes differently? Instead of being things people possess inside their heads, what if attitudes were understood as psychosocial matter existing like any other participant in the action taking place? To do this, we would need to reconsider a number of precepts; for example, how we understand and attribute agency, varieties of worldly relationship, and so on. Simply invoking a more relational view of individuals engaging with the world won't do. Versions of constructivism have been offered in this regard, but these remain theoretically tied to the kind of dualism that marks a distinct psychological interior from the material external world (e.g., Kelly, 1991; Seligman, 2011). Beyond behavioral and cognitive-behavioral theoretical dominance in special education, cognitive-behavioral and constructivist models continue to overshadow Disability Studies. Critical Disability Studies has been quick to recognize the shortcomings of dominant psychological theory with contributions in this area examining opportunities where alternate kinds of psychological theory (e.g., social constructionism) and disability studies might be mutually beneficial (Billington and Goodley, 2020; Rapley, 2004).

To move psychology out of the heads of people and into an active world, what is needed is a form of transdisciplinarity capable of speaking to psychological, biological, social, economic and political concerns. A form of psychosocial understanding that resists separating people from their world, or ontology and epistemology. Put another way, a psychosocial understanding that might account for life as it is being made rather than one that pre-exists engagement (cf. Brown and Stenner, 2009). In searching for collaborators, we can reach back thirty years to Potter and Wetherell's primer in discursive psychology, *Discourse and Social Psychology: Beyond attitudes and behavior*. Against the grain of contemporary mainstream social psychological research, this early prototype for discursive social psychology sought to explore two main concerns: (i) how language is constructed in local contexts, and (ii) what consequences might ensue from particular types of construction. Discursive psychology is not preoccupied with establishing the existence of mental properties, but instead focuses on "the organization of discourse in relation to function and context" (Potter and Wetherell, 1987, p. 54). More recent discursive psychological accounts acknowledge the increasing complexity involved in social psychological theorization of attitudes (e.g., social cognitive theory), but acknowledge these as retaining uncomplicated accounts of representational language use and separation of the individual from their surroundings (McVittie and McKinlay, 2017).

While discursive social psychology provides valuable recourse to examining psychological life, this work should not be taken as homogenous nor without reservation (Bozatzis, 2014). In particular, an enduring treatment of epistemic and ontological concerns continues to hinder potential theoretical developments (Wetherell, 2007). For example, in a recently published piece on topic, Potter et al. (2020) persist with invocation of a "natural" world within which human beings develop "assessments" or attitudes. As flagged above, this chapter is interested in pursuing Barad's (2007) notion of onto-epistemology where potential dilemmas regarding ontology and epistemology are ethically inseparable. For us, as researchers, "... an invitation to live justly is written into the very matter of being. How to respond to that invitation is as much a question about the nature of response and responsibility as it is about the nature of matter" (Barad, 2007, XI). Recognition of an existing yet insufficiently theorized natural world continues to be an ethical dilemma I encounter with this type of research (cf. Corcoran, 2009).

In the space remaining I want to move on to suggest several proposals for how attitudes research in education might take place. It is important to emphasize these propositions should not be taken as "How To" instructions for the work ahead. To even hint at that would denigrate all that I have attempted to share in this discussion. To do so would return us to the kind of monologic telling-it-like-it-is approach that so often fails to open possibilities, encasing our exchanges in closed probabilities instead. I now join in chorus with one of my cultural heroes, who when describing his craft reflected: "My business is SHOW business and that is the business of SHOWING ... not TELLING. You don't TELL people anything, you SHOW them, and let them decide" (Springsteen, 2016, p. 277; upper case in original). In this vein, allow me to show how we can do research that might satisfy our ambition if inclusive education is central to that prospect.

Dissolving inclusion

There is a fundamental distinction here regarding how we approach and engage disability and attitudes, as well as knowledge of other kinds of things for that matter. Above, I discussed how Disability Studies has challenged traditional representations of people living with impairment and how psychology generally purports to know these things called attitudes. In combination, the ever-growing literature theoretically refines the existence of attitudes toward disability as things already possessed by us and epistemologically proves their ontology through rigorous scientific method. But what if we were to reconsider attitudes not as already existing; that is, things waiting to be found like one's car keys or the television remote control, but as things made by us in our continuous engagements with one another and the world? In this regard, as researchers might we then refrain from allowing our inquiries to be determined by what is already known (e.g., categories in the DSM), and in so doing be enabled to notice how our own actions in engagement with our material world bring different things like attitudes concerning disability into existence. This is not to suggest we discount certain research traditions and what those have had to contribute to date. But what I am attempting to do here is call out inquiries which separate ontology and epistemology as particular kinds of after-the-fact accounting (Shotter, 2017), and in doing so, move to reorient education research and practice in the area toward other possibilities.

British psychologist John Shotter worried about the ways social scientists usually go about analyzing life. Or, to reiterate Barad's earlier statement, what "the nature of response and responsibility" means for doing research. Shotter's key concern held that most research disrespects the unfinalisability of living things, geared as it is to produce reified accounts of life already lived. In these kinds of after-the-fact tellings, decisions are reached methodically by retrospectively weighing up evidence to solve real-world problems. Problems are "broken down" or "pulled apart" so we might capture how they materialize to get a clearer and more accurate view of

Table 1 Options for attitude research.

	<i>After-the-fact</i>	<i>Before-the-fact</i>	
Retrospective	Attitudes are fixed	Attitudes are emergent	Prospective
Solving	Attitudes are faulty	Attitudes are entangled	Dissolving
Representation	Attitudes are found	Attitudes are made	Orientation
Reflection	Attitudes are facsimiles	Attitudes are equivocal	Diffraction

their constituent parts. The dominant mechanistic metaphor of our time tells us that if we isolate the problem, we will then be able to diagnose dysfunction and correct what needs to be corrected to make things work. This is how statistical significance, derived from responses to technologies like attitudes questionnaires, is intended to contribute to the goal of attaining equitable education in our schools.

Closer to the kind of onto-epistemological work I have been discussing here, Shotter proposed a form of before-the-fact engagement to assist us in responsibly meeting the world in and through research. As just mentioned, as researchers we have been trained to solve problems. Not all problems are the same of course, nor are their solutions. Nor is might what we see as problematic understood by others similarly across various situations. Already from what has been said we start to sense the pebble in the shoe of the researcher. If our intent is to remain part of a living world and speak in ways that potentially sustain possibilities for how we can go on together, our efforts may not be well spent producing after-the-fact evidence (e.g., isolating teacher's attitudes) in service of final solutions (e.g., attaining inclusion). Promises like this often offer false hope and any who have worked in government possibly know what I mean here. Perhaps, rather than exclusively solving problems using after-the-fact derived evidence, our purpose might just as importantly be directed at dissolving problems. Dissolved problems are diffused phenomena, irrevocably altered if and when extracted, reduced or withdrawn from the unique whole in which they exist. As **Table 1** shows, in considering how researchers might conserve the entangled nature of living worlds, our work should orient to dissolving problems as before-the-fact venturing.

This discussion regarding after- and before-the-fact venturing relies considerably on how we orient ourselves with/in the world. For example, earlier I made reference to research findings and makings. The point can be extended by current academic distinctions contrasting how reflection and diffraction are used in research ([Bozalek and Zembylas, 2017](#)). As learners we have been taught the value of reflective practice whereby we scrutinize our actions and observations looking to gain greater insight so as to inform what comes next. Immediately, this process can be spotted for its retrospectivity and after-the-fact way of working. Reflection can also be appraised metaphorically for the act is suggested to be a form of cognitive mirroring insusceptible to the potential affections involved in any process ([Rorty, 1979](#)). That a researcher can use language to transparently represent what is, for example, attitudes meaningfully derived from statements posed on questionnaires, is highly contentious for, as suggested above, it falsely presumes and unethically generates response homogeneity.

This then is seemingly one of the greatest challenges of our time. Gated communities describe the boundedness of physical areas created to securely separate a like-minded us from the (for whatever reason) unwanted them ([Bauman, 1997](#); [Sennett, 2018](#); [Slee, 2018](#)). Similarly, for as long as there have been universities, people have recognized the intellectual silos created between disciplines and traditions of argumentation ([Billig, 1987](#)). Around the globe today, commentators both academic and social worry about the influence rapid developments in technology are having on what information we are exposed to and what information we in turn expose ourselves to. Populist political leaders cash in on this zeitgeist, furthering exclusions and promoting divisions wherever and whenever possible, gating not only their communities, but potentially even their countries. Looking prospectively, orienting research practice to include diffractive engagements may help in dissolving contemporary problems by "carefully and attentively doing justice to a detailed reading of the intra-actions of different viewpoints and how they build upon or differ from each other to make new and creative visions" ([Bozalek and Zembylas, 2017](#), p. 118).

Conclusion

Much of the research that aims to interrogate attitudes of non-disabled people toward students with disabilities proceeds from accepting disability as a stable or fixed phenomenon that refers to the pathological composition of individuals. Accordingly this research has been linear in design, application and trajectory, moving as it does from specific cohorts of able-bodied people to tap and adjudicate their reactions to students with disabilities in general, or to students who are attached to particular diagnostic categories. Herein lies a largely unrecognized and unacknowledged onto-epistemological chasm. The very framing of the research question about attitudes toward students with disabilities is emblematic of the foundations of disablement and exclusion. It is an exquisite representation of the creation and nurturing of discrimination through particular forms and expressions of knowing the world, knowing people and knowing the disabled person—simply, knowing/being. The critique of this research genre undertaken above is not an academic—and academic is used frequently as a pejorative term of reference—exercise in polemics. It is offered to stimulate radically different discussions about knowing/being human ([Goodley, 2021](#)).

Accounting for existing conditions via after-the-fact practices like specifying attitudes no longer need be claimed as a primary means to effect change in education. Researching attitudes, and to a certain degree other kinds of psychosocial sensemaking

(including educational favorites like grit (Corcoran and Vassallo, 2021) or behaviour (Corcoran and Thomas, 2021), can instead be engaged as prospective activity where “to understand is to anticipate together, it is to make a cross-reference which, when acted upon, brings about a partaking in a common, inclusive, undertaking” (Dewey, 1929/1958, pp. 178–179). How does initiating before-the-fact orientations moves us closer to dissolving inclusion? It does so by calling upon our anticipations, that is where we decide to commence our work, to ethically address available onto-epistemological possibilities. What should be heralded are those starting points which configure our ways of knowing/being in certain terms at certain times and places and whether these create preferred ways to go on together. Should ableist understandings of students, for instance, set the coordinates for educational practice? And what, to conclude, would the significance then be of inclusive education were this not our point of departure?

Introduction

As the name suggests, Universal Design for Learning (UDL) is about creating access for everyone. UDL has been developed from the broader concept of Universal Design. In the United Nations Convention on the Rights of Persons with Disability (CRPD), Universal Design is defined as “the design of products, environments, programs and services to be useable by all people, to the greatest extent possible, without the need for adaptation or specialized design” (United Nations, 2006, Article 2). In addressing the topic of implementing UDL, at its core, this chapter is about accessibility. Accessibility is a precondition for upholding human rights since human rights cannot be upheld without accessibility across every aspect of human society. The essential nature of accessibility is outlined in the Universal Declaration of Human Rights (United Nations, 1948) and the International Covenant on Civil and Political Rights (United Nations, 1966). Consequently, accessibility is a core principle underpinning the CRPD (United Nations, 2006). This principle is explored extensively in General Comment 2 on the CRPD, which unpacks Article 9 on accessibility (United Nations, 2014). It is also directly applied to education in General Comment 4 on the CRPD, which addresses Article 24 on inclusive education (United Nations, 2016). On this basis, UDL becomes a fundamental strategy for upholding human rights.

Universal Design is an approach that is widely beneficial as it facilitates the creation of a world in which all people are considered, a world that is accessible to all people, and a world that will not always require constant “retro-fitting” in order to uphold basic rights and address the basic needs of many individuals. It is important to note, though, that Universal Design does not mean creating a “one-size-fits-all” approach in which we all do the same thing, in the same way, or at the same time. Instead it involves examining who is considered in the design of our world, who is missing in these considerations, why, and how this can be addressed in order to make design universal—as in, for all of us. As is further explicated in the CRPD, “‘Universal design’ shall not exclude assistive devices for particular groups of persons with disabilities where this is needed” (United Nations, 2006, Article 2). While such assistive devices may only be used by some of us, or some of the time, the incorporation of these into Universal Design is essential in ensuring that the design is genuinely “universal”.

Originating in the field of architecture, Universal Design examples include: curb cuts; automatic doors; ramps; lifts with visual, audio and braille information; wide doorways; closed captioning; and in-built screen readers (CAST, 2018). Thinking about the concept of Universal Design always brings to mind for me an old cartoon by Giangreco and Ruelle (2002). Giangreco and Ruelle’s cartoon depicts a school that has been snowed in. The entrance to the school is blocked as the stairs and ramp are covered in snow. There are a group of students waiting to get into the school. One student, who uses a wheelchair, asks the adult who is shoveling snow off the stairs, “Could you please shovel the ramp?” The adult responds, “All these other kids are waiting to use the stairs. When I get through shoveling them off then I will clear the ramp for you”. The student replies, “But if you shovel the ramp, we can all get in!”.

To me, this cartoon illustrates both the mistaken association of Universal Design as being only for some people (in this case, the student who uses the wheelchair) and, in contrast, the genuine and logical benefits of creating accessibility for everyone. The cartoon also draws our minds to the attitudinal aspects of the implementation of Universal Design—beyond the architectural considerations. The school depicted *does* have a ramp, and yet the ramp is viewed as secondary to the stairs at the entrance to the school.

It is noteworthy, however, that the importance of the existence of the ramp is not to be underestimated, as those of us who have attempted navigating the world around us with the use of mobility aids can attest to. Although the cartoon may be coming up to 20 years old, many such ramps (and other avenues for accessibility) are brand new or not yet in existence.

This example, while specific, can be extrapolated endlessly and the benefits to everyone of accessibility are timeless. Consider pulling a suitcase, pushing a pram, or a trolley and the universal aspect of this design becomes readily apparent. However, the reality that we are still so often retro-fitting the world around us highlights that Universal Design requires a transformational approach whereby we *rethink* the ongoing planning of the world in which we live so that planning is

by all of us and *for* all of us—critically, reflecting the mantra of “nothing about us without us” as a core aspect of universal approaches. This doesn’t mean only having ramps and no stairs—in reality ramps are not actually accessible to all of us—but it does mean that when we are designing building access points we need to ensure that ramps and lifts and braille and appropriate width doorways and clear signage, for example, are an equally important part of the planning and building use, from the outset. This is not yet, and has not been, the reality. While some aspects of accessibility are relatively commonplace in some parts of the world now, even the humble curb cut is an example of a hard fought “win” in working toward accessibility (Hendren, 2020). As Hendren (2020) explains, the battle for curb cuts in North America included disability activists pouring concrete on curbs or smashing sections of existing concrete curbs to flatten them in order to create “do it yourself” curb cuts, in response to the circular arguments of city planners that curb cuts were not necessary since disabled people were never seen out on the street.

In unpacking the significance of such changes to the built environment, Hendren (2020) builds on the work of Hayward and Swanstrom (2011) who conceptualize the inequities of built environments as being examples of “thick injustice”. Thick injustices can be understood as aspects of our societies and environments that are so deeply embedded and accepted without question that they lead to a raft of largely unrecognized injustices that seem both permanent and inevitable as we struggle to imagine the world other than what it is in the here and now (Hayward and Swanstrom, 2011). Within and beyond built environments, the notion of thick injustices speaks to the seemingly endless argument that accessibility is expensive and requires resources that “people might not have”. Importantly, (and separate to the counter-argument that if we are all equally humans then the rights of some of us are not rendered invisible or secondary to the rights of others of us), Universal Design provides a valuable opportunity from which it is often possible to circumnavigate these issues through planning for *all* from the outset (and thus avoiding the need for costly and time-consuming retrofitting).

Reflecting on the seemingly intractable, and yet fully alterable, realities of the built environment, and the need for Universal Design, we can recognize the attitudinal underpinnings that require addressing—which may be more difficult to shift than bricks and mortar (or indeed concrete). At the core of considerations of accessibility (and inaccessibility) are the “normalizing” beliefs that narrow humans and our ways of being and doing—as if human diversity simply does not exist, or at the very least that it does not need to be accounted for, or indeed that it is an “expensive inconvenience” best left ignored. Implementing Universal Design is one important tool through which we can begin to address these attitudinal and material barriers—and injustices.

Universal Design for Learning

Although beset with the complexities of thick injustice, the importance of Universal Design, and its application and implementation, is nonetheless relatively easy to wrap our minds around once we start to think about the physical accessibility of environments. However, the environment, while a significant domain for the production and reproduction of injustices, is only one of many aspects of *inaccessibility*. When we consider accessibility within pedagogy, and the curricula that emerge from it (Ellsworth, 2005), we turn to UDL.

The notion of UDL developed through applying notions of Universal Design to the ways in which we teach and learn. The framework of UDL is generally understood to have been developed by David Rose, Anne Meyer and colleagues at CAST (previously, the Center for Applied Special Technology) in Massachusetts, USA. UDL philosophy and practice is embodied in a set of three principles that address the “why”, “what” and “how” of learning, through creating accessible “universal” approaches to engagement, representation, action and expression (CAST, 2018). In seeking to create “universal” approaches, the question of “who” we are planning for also becomes key.

Of course, for any of us to genuinely engage in and benefit from educational opportunities, we must first have access to those very same opportunities. Thus, this need for accessibility seems rather self-evident. However, for many students, learning opportunities are inaccessible, preventing participation and engagement and creating a vastly inequitable “playing field”. This has serious implications at many levels. Pressing the “snowy ramp” analogy a little further, the ramp is necessary but it also needs to be useable and valued—as in, “access” that is actually accessible, available, and respected as legitimate. Taking a UDL standpoint means that such accessibility becomes no longer a privilege or an option, it is the realization of a fundamental human right for all. As stipulated in General Comment 4 on the CRPD “[c]urricula must be conceived, designed and implemented in such a way as to meet and adjust to the requirements of every student, and provide appropriate educational responses” (United Nations, 2016, paragraph 26).

UDL is intended to address—and, ultimately, remove—barriers to educational accessibility that create, but also go far beyond, access to *information* and instead facilitate access to *learning* (Edyburn, 2005). Applying principles of Universal Design to education means that—consistent with teaching as a *creative* role, rather than a task for “transaction” or “transfer” of knowledge—we create and implement pedagogies and curricula that are built on a foundation of recognizing and valuing humans in all our diversities and proactively and responsively plan for flexibility in enabling genuine access to equitable educational opportunities for all students (Cologon and Lassig, 2020; Edyburn, 2010; Glass et al., 2013). UDL is underpinned by the idea that “learner variability is the rule not the exception” and that UDL as an approach is innovative, strengths based, and

benefits everyone (CAST, 2018; Glass et al., 2013). At its core, implementing UDL is about providing multiple representations of information, ways to engage, and different ways to express knowledge and learning, with the emphasis on the role of the teacher in creating valued and recognized access for all through careful planning (Kurth, 2013).

The United Nations Committee on the Rights of Persons with Disabilities defines UDL as:

a set of principles providing teachers and other staff with a structure for creating adaptable learning environments and developing instruction to meet the diverse needs of all learners. It recognizes that each student learns in a unique manner and involves: developing flexible ways to learn, creating an engaging classroom environment; maintaining high expectations for all students while allowing for multiple ways to meet expectations; empowering teachers to think differently about their own teaching; and focusing on educational outcomes for all, including persons with disabilities.

United Nations (2016, paragraph 26).

Applying a framework of UDL can facilitate the development of pedagogy and practice underpinned by the recognition of the reality that people "... all operate across a spectrum of emotional, perceptual, and cognitive capacities and proclivities when we learn" (Glass et al., 2013, p. 99). Valuing human diversity and taking an anti-oppressive approach can support us in addressing the barriers otherwise presented through narrowly conceived pedagogies that do not recognize or build on human diversity (Symeonidou, 2020).

At a philosophical and practical level, UDL involves the recognition that student outcomes and abilities, rather than being inherent or individual, are the result of interactions between an individual and their environments (Rose et al., 2018). Applying this thinking then creates opportunities to recognize that "poor outcomes" or "low performance" can often be a consequence of inaccessibility in the design of the learning experiences, materials, or the assessment approach (Rose et al., 2018).

UDL is a cohesive and logical framework and philosophical standpoint from which to approach planning that is inclusive of all students. In its implementation, though, UDL has been criticized as being interpreted and applied in limited ways that do not include all students, in particular students with intellectual disabilities (Smith and Lowrey, 2017). While the intention of universality is self-evident, even in the name UDL, explicit consideration of who we are as diverse groups of humans—and equal valuing of the importance of access to equitable educational opportunities for *all* of us—is needed to bring the promise of UDL even close to a reality. Consequently, it is helpful to dig deeper to start to address how UDL can be implemented in a way that is authentically inclusive of all, including (from a social model perspective) students who experience the imposed social oppression that constitutes disability.

UDL: a social model approach

At its core, UDL is understood to be a responsive framework that is flexible and strengths based and facilitates high expectations and authentic access to education (Cologon and Lässig, 2020). Implementing UDL involves considering every aspect of pedagogical planning and assessment to determine how it enables (or can enable) multiple means of engagement, multiple means of representation, and multiple means of action and expression in order to enable learning for all students (CAST, 2018). This includes considering how students can be provided with positive and appropriate motivators and feedback to engage with learning (for example, choice, modeling, and reflection), what scaffolds can be put in place to ensure that representation is accessible to all students (for example, visual and auditory alternatives and markers and explanations of key information), and what resources and modes of accessing learning can be put in place (for example addressing methods of communication and the role of technology in facilitating participation and demonstrating of knowledge) (Cologon and Lässig, 2020).

Taking this approach requires identifying potential barriers to learning within the pedagogy and curricula and multiple solutions to these barriers. The emphasis, therefore, is on why, how, and what the *teacher*—and all those involved in educational teams (including teaching assistants and principals and so forth)—can do (and provide) to enable access to learning for *all* students (and what barriers can be addressed within pedagogical practices). This involves moving away from a focus on what a *student* might *not* be able to do as the barrier. It also involves a rejection of the ableist and mythical notion of a "normal student".

The idea of planning for "normal students"—with or without the intention of making adaptations for some (therefore inferred to be "abnormal") students—is a traditionally accepted approach to education that is underpinned by a deeply ableist "medical model" understanding of human diversities. Taking an example from Australia, the Australian Curriculum (Australian Curriculum, Assessment and Reporting Authority [ACARA], n.d.) still uses the definition of disability from the 1992 Disability Discrimination Act in which disability is defined as:

"total or partial loss of the person's bodily or mental functions

- total or partial loss of a part of the body
- the presence in the body of organisms causing disease or illness
- the presence in the body of organisms capable of causing disease or illness
- the malfunction, malformation or disfigurement of a part of the person's body

- a disorder or malfunction that results in the person learning differently from a person without the disorder or malfunction
- a disorder, illness or disease that affects a person's thought processes, perception of reality, emotions or judgment or that results in disturbed behaviour" (ACARA, n.d., n.p.)

Focusing on disability, a medical model perspective holds that, disability is the opposite of ability, that disability is impairment, that disability is necessarily negative or tragic, that to be disabled is to be "lesser" or "inferior"—in some sense "broken", that disability is an undesirable state of being, that those of us who experience disability need to be "fixed", and that disability needs to be eliminated or ameliorated (French and Swain, 2004). When viewed from a medical model perspective, the impact and role of society in disabling people is either not recognized or actively not seen to exist (French and Swain, 2004; Thomas, 2004).

Disability Rights Activists and those within the field of Disability Studies have worked hard to disestablish this ableist way of viewing each other as humans, with many implications for education. The social model of disability, despite many critiques, provides an alternative—and productive—viewpoint. As Oliver (2004, p. 21) writes:

In the broadest sense, the social model of disability is about nothing more complicated than a clear focus on the economic, environmental and cultural barriers encountered by people who are viewed by others as having some form of impairment—whether physical, mental or intellectual. The barriers disabled people encounter include inaccessible education systems, working environments, inadequate disability benefits, discriminatory health and social support services, inaccessible transport, houses and public buildings and amenities, and the devaluing of disabled people through negative images in the media—films, television, and newspapers.

Understanding a social model of disability may be beneficial to applying UDL. UDL can also be viewed as a parallel to the social model in that it relocates the "problem" to society (in this case to the education setting, pedagogy, or curriculum) rather than viewing the "problem" as/within the student. Within UDL the challenges identified within a social model understanding are then actively and directly addressed through ameliorating *barriers* within *society*—in this case, within education in particular.

Like others before me, I would argue that applying a social model approach to education is not to ignore criticisms of the social model, nor to propose a "disembodied" understanding of disability (for discussion of the social model, see Hughes and Paterson, 1997; Oliver, 2013; and Siebers, 2019). Including the bio-social aspects of impairment, as explored below. However, applying a social model approach to UDL is to acknowledge the social and material barriers that impact on the participation and lived experiences of those of us who are disabled, and proactively work toward ameliorating these problems that prevent participation.

In building on earlier conceptualizations of the social model, and in addressing some of the key criticisms (including the "disappearing body"), Thomas (1999, 2001, 2004, 2007, 2010, 2012, 2019) offers a *social-relational* understanding of disability. A social-relational understanding of disability incorporates the oppressive social and relational aspects of disability (disablism), alongside the individual lived experience of the bio social effects of impairments (impairment effects). In explicating the bio social nature of impairment effects, Thomas (2019, p. 1040) identifies that impairments are "bio social in character i.e., they have real material bodily effects and are simultaneously culturally constructed especially by the medical profession and bio/scientists in the West in current times". In offering closing remarks on her contribution to the theorizing of disability, Thomas (2019) reiterates the ongoing and pressing relevance of these two key aspects of disability in the form of disablism and impairment effects.

Disablism: refers to the social imposition of *avoidable restrictions* on the life activities, aspirations and psycho-emotional well-being of people categorised as "impaired" by those deemed "normal". Disablism is *social-relational* in character and constitutes a form of *social oppression* in contemporary society—alongside sexism, racism, ageism and homophobia. As well as enacted in person-to-person interactions, disablism may manifest itself in institutionalised and other sociostructural forms.

Thomas (2010, p. 37).

Impairment effects: the direct and unavoidable impacts that "impairments" (physical, sensory, intellectual, emotional) have on individuals' embodied functioning in the social world. Impairments and impairment effects are always bio-social and culturally constructed in character and may occur at any stage in the life course.

Thomas (2012, p. 211).

From a social-relational understanding of disability, disablement can further be understood to occur through "barriers to doing" and "barriers to being". Barriers to doing constitute avoidable socially imposed environmental or economic material barriers to participation—for example, all forms of access barriers (Cologon and Thomas, 2014). Thus, the core considerations in implementing UDL. Barriers to being, incorporate the attitudinal factors that need to be addressed if the thick injustices within disablism are ever to be adequately countered. As Thomas (2007, p. 72) outlines, barriers to being are enacted as a process of psycho-emotional disablism, which "involves the intended or unintended 'hurtful' words and social actions of non-disabled people (parents, professionals, complete strangers, others) in inter-personal engagements with people with impairments". For example, one aspect of considering representation includes directly addressing barriers to being.

When we consider these concepts in relation to implementing a framework of UDL, we can see that, as part of the “who”, impairments and impairment effects are one of many forms of human diversity. As a “universal” framework, necessarily then, in implementing UDL we are actively planning and creating pedagogy and curriculum that is accessible to students who experience impairment effects. This has implications for engagement, representation, action and expression. If we are to engage in anti-oppressive pedagogy, this also means that in addressing this matter of “who”, and planning for multiple methods of engagement, representation, action and expression, we will be directly addressing barriers to being and barriers to doing. Arguably then, not only can UDL be considered an implementation of a social relational model in practice, but a social relational model—in particular the concepts of barriers to doing and barriers to being—can be a useful tool to use in implementing UDL.

Symeonidou and Chrysostomou (2019, p. 363), in research with public primary school teachers in Cyprus found that “disability-focused anti-oppressive pedagogies do not view disability as the exact opposite of ability. Anti-oppressive pedagogies seek to make a difference by understanding disability as a form of social oppression, but at the same time they appreciate disability as a lived experience, and as a complex discursive, cultural, and historic construct”. Going on to explain that “This realization means that a social model of disability informs anti-oppressive pedagogies, without ignoring other factors related to disability” (Symeonidou and Chrysostomou, 2019, p. 363).

UDL can, therefore, be understood and implemented as an *anti-ableist* and anti-oppressive framework for education. However, although this is possible it is not necessarily the case in application. UDL can also be superficially applied without any attempt to address the thick injustices within education thus existing within, or even further contributing to, oppressive pedagogies—as in, pedagogies that present some of us, for example those of us who experience disability, as passive and deficient, in need of pity (Symeonidou and Chrysostomou, 2019). While the potential to exist within or even perpetuate oppressive pedagogies could be considered an inadequacy of UDL, perhaps the focus instead needs to be on how we understand and implement UDL as an aspect of anti-oppressive pedagogies.

Harking back to Hayward and Swanson’s (2011) conceptualization of thick injustices underlines the extent to which oppression is an insidious and everyday encounter for so many of us. Pedagogy and curricula are no exception to this reality. However, when we shift our thinking from planning and implementing pedagogies from a “central” point (stemming from myths of “normal”) with variations retrofitted toward UDL, we open possibilities to move beyond deficit understandings of students toward creating the space to recognize and address the barriers to learning and opportunity that are otherwise often hidden and unexamined. At a fundamental level, one aspect of such an anti-oppressive UDL approach requires engaging with a social model understanding of disability, from which we can recognize that disability is negatively experienced through social (including attitudinal) and material (including environmental and curricular) barriers imposed upon those of us who are, therefore, disabled. The key transformation in thinking that is necessary here, is to move from viewing barriers or “problems” as existing within individuals (a deficit based/medical model understanding) toward recognizing that barriers exist in the interactions between people and our societies (a social model understanding) and therefore that UDL—and indeed the project of democratic education—is about removing social and material barriers in order to produce and engage all students within accessible, equitable and meaningful learning opportunities. This requires applying a social model approach to understanding and implementing UDL. As such, taking a social model approach to implementing UDL can have benefits for ensuring the “universal” aspect of UDL not only in recognizing and including those of us who experience disability, but beyond this in relocating our focus from seeking to change, or exclude, students, or even on retrofitting learning experiences that were designed for the elusive “majority”, toward a productive focus on pedagogies for all.

One avenue through which we can apply a social model understanding to the implementation of UDL is through drawing on Disability Studies as a core aspect of informing our understandings and implementation of UDL as anti-oppressive curricula and pedagogies. As Symeonidou (2020, p. 2) explains, “Disability Studies provides the framework to rethink disability and infuse a disability perspective into the curriculum”. The ongoing lived experience of oppression for so many of us results in an active need for anti-oppressive curriculum and pedagogies (Symeonidou, 2020). Symeonidou (2020, p. 2) proposes the need to draw on critical pedagogy (informed by Paulo Freire and others) and postcritical pedagogy (informed by Michel Foucault and others) “in order to follow pedagogies that do not present the person with a disability as the Other ... but rather encourage learners to understand that disability is a form of social oppression that needs to be challenged” and to ensure that “disability” is not viewed as the opposite of “ability”.

However, at present, those of us who experience disability are largely “invisible” within curricula and pedagogy, it falls upon educators to bring this perspective to everyday practice (Valle and Connor, 2019). This is where guidance for educators, from a social model perspective, is essential. Without such guidance from a Disability Studies approach, no matter how well-meaning and dedicated the teacher, such instruction is likely to “accidentally” fall into oppressive pedagogy in which disability is cast in an ableist light as a within-person deficit in need of amelioration or elimination (Symeonidou and Chrysostomou, 2019) and as a reason for which a student—or entire group of students—can or should be excluded from the classroom and curriculum. A viewpoint from which—ironically—UDL can be justified as an approach for *some* and not *all* students.

Progressing forward with UDL

UDL offers a great deal of promise. However, as I have explored above, in its implementation UDL does not necessarily “live up to” this promise. Drawing together the notion of anti-oppressive pedagogies and building on a social model understanding of the

barriers that students often face may have the potential to create a space for implementing UDL as a framework for planning environments and pedagogies that reduce rather than perpetuate barriers to educational opportunities. Translating the intention of UDL beyond the material and into the attitudinal holds possibilities for contributing to addressing the thick injustices that include but also go far deeper than the (nonetheless essential) existence of ramps or accessible learning materials.

As explored within this chapter, implementing UDL involves a process of considering every aspect of pedagogical planning and assessment to determine how, *as teachers*, we can enable multiple means of engagement, representation, and action and expression in order to enable learning for all students (CAST, 2018). I would argue that UDL has the potentiality to be used to genuinely contribute toward more inclusive education experiences and systems through anti-oppressive pedagogies and the curricula that emerges from them. Again, though, this requires remembering that UDL is not about taking a one-size-fits-all approach. Instead—through a focus on teachers and *how* we teach—UDL forms a flexible and responsive approach that starts from the position of recognizing, valuing, planning and implementing pedagogies and curricula for the diversity of students. Reminding us of Slee's (2011) call for "irregular schools", it could perhaps be argued that UDL holds such potential that it could be used as a framework for transformation of education settings, pedagogies, curricula, and systems even to a point where it would be possible to move beyond talk of "inclusion" and "exclusion" toward education for all in a deep sense—an education that is accessible to all in material and practical senses and, importantly, within which *all of us* are welcome, valued, and seen as worthy members of educational settings and experiences.

Over the last few decades, considerable attention has been directed toward the development of inclusive schools, with significant efforts being made both at the international and national level to specifically promote increased enrollment, engagement and learning outcomes for children with disabilities. Two rather significant international developments have been the adoption of the United Nations Sustainable Development Goals [SDGs] (United Nations, 2020) and the United Nations Convention on the Rights of Persons with Disabilities [CRPD] (2006, 2016). The SDG 4 “inclusive and equitable quality education” and promoting “lifelong learning for all” is part of the United Nations (UN) 2030 Agenda for Sustainable Development pledge to leave no-one behind. The agenda promises a “just, equitable, tolerant, open and socially inclusive world in which the needs of the most disadvantaged are met.” Several high-profile declarations in the past decade have signaled growing regional interest in providing access to education for children with disabilities (Global Education Monitoring Report, 2020). Research evidence notes that over the years there has been a positive impact globally with rates of enrollment increasing slowly, though considerable disparities remain within and across countries. For example, in India official estimates suggest a significant increase in enrollment numbers of children with disabilities over the past two decades. However, significant disparities within states exist (Singal et al., 2017). While enrollments have shown an increase, there are significant concerns in relation to issues around classroom experiences, engagement with the pedagogical processes and learning outcomes, as evident in the data from Pakistan (Malik et al., 2020; Singal et al., 2018).

Even though significant efforts are being made to include more children with disabilities into the education system, very little attention has been given to increasing diversity among those working in these school settings. The report “Transforming the Education Workforce” published by the Education Commission (2019) noted that an increasingly diverse student population needs a deeper engagement with a diversified teacher workforce. However, discussions on teacher diversity in countries around the world tend to focus on race, gender and ethnicity with very little attention being paid to disability.

Globally, participation of persons with disabilities in the workforce remains a challenge. As Stoveska (2020) discussing data collected by the International Labor Organization (ILO) notes, “People with disabilities are less likely to participate in the labor force: almost two-thirds of those who are of working age are outside the labor force” (n.p.). Worldwide, the statistics show that “Only one in three people with disabilities is employed on average. Significantly, they are two times less likely to be employed than people without disabilities” (Stoveska, 2020, n.p.). These figures are consistent with several other studies. Lamichhane (2015) noted that, “with regard to the participation rate of people with disabilities in the labor market in various countries, the available employment statistics are not encouraging” (p. 23). Mizunoya and Mitra (2013) using data on developing countries from the World Health Survey, showed that people with disabilities generally experience lower employment rates compared to their non-disabled counterparts, and the unemployment rate of persons with multiple impairments is even lower than those with single impairment. Data from the World Report on Disability (WHO, 2011) for 51 countries further shows that while the employment rate is lower for people with disabilities compared to their non-disabled counterparts, it is even more serious for women with disabilities. As Lamichhane (2015) outlines, a range of factors such as the lack of access to education and training, nature of the

workplace, or employers' perceptions/misconceptions of disability as not being very productive for example, could all contribute to their continued exclusion from the labor market.

The aim of this chapter is two-fold: (1) to highlight what the current literature tells us about teachers with disabilities working in mainstream schools; and (2) to discuss insights from an exploratory study undertaken with teachers with disabilities across four Low- and Middle-Income Countries (LMICs).

Insights from current literature of teachers with disabilities

In the recent past, there have been several studies focusing on the experiences of teachers with disabilities, but these have primarily been undertaken in Northern contexts. 53 research studies were identified in a review of this literature published in [Neca et al. \(2020\)](#), highlighting themes around teachers' life trajectories, educational practices and challenges; impact and need for teacher training, students and school principals' perspectives about teachers with disabilities, while revealing the underrepresentation of teachers with disabilities.

[Singal and Ware \(2021\)](#) undertook a review of existing databases, specifically databases of the Education Resources Information Center (ERIC) and the British Education Index (BEI), to identify literature on teachers with disabilities working in mainstream school settings. Of the 59 articles identified in this review, more than a third ($n = 21$) focused on the experience of teachers with learning difficulties, primarily those with dyslexia. Teachers with sensory impairments (hearing and/or visual impairments) were the second most frequent ($n = 12$), followed by thought pieces and/or articles not specifying type of disability ($n = 11$). Studies reflecting on teachers with physical disabilities ($n = 6$), those who were Autistic ($n = 1$) and those working across a range of impairments ($n = 8$) were the least common. Few of the existing studies were subject specific, although three studies focused on physical education (USA), two looked at music education (USA) and one at science education (UK). The existing literature provides some interesting insights around motivations for becoming a teacher, with reasons such as pragmatic factors (pay, holidays, etc.), personal variables (passion for working with children, having relevant skills, etc.), and a strong sense of social justice ([Ware et al., 2021](#); [Ferri et al., 2005](#)) being often cited. Tensions around disclosure of one's disability status, particularly hidden disabilities, are identified in the literature, with [Saltes \(2020, p. 22\)](#) suggesting that the "normalizing ideology" of a "capable teacher" is a substantial barrier which causes both attitudinal and physical difficulties. This was markedly highlighted in the work by [Valle et al. \(2004\)](#) in the USA, where their participants noted significant struggles around disclosure of their learning disabilities due to issues of stigma. In contrast, other work with teachers with dyslexia note their value to classrooms with diverse student populations ([Burns and Bell, 2011](#); [Vogel and Sharoni, 2011](#)). [Ware et al. \(2021\)](#), researching in England with ten teachers and trainee teachers having a range of disabilities, found that while there was a strong discourse of inclusive education in schools, this did not extend to teachers. As a result, nine out of ten teachers faced difficulties and discrimination at work, with the individual being made responsible for adjusting rather than the barriers in the system being addressed. Similarly, in Israel, [Alon and Lishchinsky \(2019: n.p.\)](#) note that "dealing with the school environment is often more difficult and demanding than coping with the disability itself."

Findings from the literature highlight the central role of teachers with disabilities in the classroom as positive role models and for improving teaching and learning practices. [Anderson \(2006, p. 368\)](#) argues "... pedagogy is also shaped by our life experiences. Teachers with disabilities offer knowledge through their bodies and experiences that isn't usually part of the curriculum. Disabled teachers embody pedagogies of justice, interdependence, and respect for differences." Similarly, [Hayashi and May \(2011\)](#) argue that to have a teacher with a disability, a respected expert in their field, contributes more to developing positive mindsets toward disabled people than exposure to disability in other contexts. In relation to teaching and learning, some studies highlight how teachers with disabilities are better able to differentiate learning activities for children, are more empathetic, and particularly empower students with disabilities ([Burns and Bell, 2010, 2011](#); [Griffiths, 2012](#); [Morgan and Burn, 2000](#); [Ware et al., 2021](#)).

Additionally, research also suggests that students tend to view teachers with disabilities largely positively. For example, [Roberson and Serwatka \(2000\)](#) found that secondary students perceived Deaf teachers to be better at teaching and were more positive toward them. More extensive work undertaken by [Bryant and Curtner-Smith \(2008, 2009a,b\)](#) in the USA examined students' perceptions of the competence of a teacher with physical disabilities in teaching Physical Education (PE), and findings showed that these perceptions could alter over time. In three studies, conducted across elementary, middle and high schools, 100 students were randomly assigned to watch one of two almost identical recorded swimming lessons. In the first video the teacher was able-bodied, and in the second video the teacher used a wheelchair. Students were then asked to complete a questionnaire on the lesson content and perceptions of the teacher. Rather worryingly, the researchers report that as students' progress through their schooling, their beliefs about PE teachers with disabilities gradually changes for the worse because "they are socialized into believing that sport, physical activity, and physical education are for what appear to be whole and fit bodies" ([Bryant and Curtner-Smith, 2009b, p. 319](#)). The researchers suggest that this is likely due to the limitations of PE curriculums which focus on athleticism and competitive sport.

Looking specifically at peer reviewed journals published in English it is clear that there is a significant lacuna of papers addressing similar issues in LMICs. Only three papers situated in LMICs were identified in the [Neca et al. \(2020\)](#) review and these were based in Nepal, Malaysia and Ethiopia. In Malaysia, [Lee et al. \(2011\)](#) conducted interviews with 24 teachers with visual impairments to understand their experiences of finding employment. The results provide useful insights into the challenges faced, the importance of individuals' personal characteristics, such as optimism, confidence, and resilience, while negative attitudes from employers and over protectiveness of parents were identified as significant barriers. It is not clear though if these teachers were employed in mainstream or specialist settings.

The study in Ethiopia conducted by Hankebo (2018) focused on exploring adopted modes of communication, teaching experiences and perceptions of deaf teachers in inclusive classrooms. Seven deaf teachers from two primary government schools were interviewed and the findings noted that, “though deaf teachers have positive perceptions for their career, they lacked appropriate pedagogical skills. It also appears that deaf teachers are highly inconvenienced by communication barriers and poor interaction, lack of technology usage, and lack of sign language interpreters” (p. 477). In a mixed methods study across seven schools from four different districts in Nepal which were employing teachers with a visual impairment, Lamichhane (2016) reported that these teachers tended not to teach subjects such as science and mathematics that require frequent use of a blackboard or illustrations of formulas. They also faced several challenges in lesson preparation, marking students’ examination papers, or teaching picture-based content due to the absence of an adequate support system, educational material, and resources. However, positive attitudes, good communication skills, as well as giving more social and moral lessons were reported by students as strengths of these teachers.

Experiences of teachers with disabilities: cross country perspectives

Given the significant lacuna of literature in LMICs, a small exploratory project was undertaken to understand the experiences of teachers with disabilities working in mainstream schools across India, Nepal, Rwanda, and South Africa. The aim of this cross-country study was not to homogenize the experiences of those with disabilities across these contexts. Rather, given that the research was being funded by an organization with global outreach during the covid-19 pandemic, we decided to recruit the sample from different countries. Additionally, given that we were unable to locate any existing networks supporting teachers with disabilities at the country level, and there being no indication of reliable data sets to know how many teachers with disabilities were enrolled in mainstream school settings, a more exploratory approach was adopted. To get an overview of the country contexts, official documents addressing issues of inclusive education, available on-line and in English, were scanned to see if teachers with disabilities were mentioned in the text.

In presenting the findings one is mindful of the fact that contextual realities shape the experiences of individuals. Nonetheless, the aim here is to provide a snapshot of the shared themes emerging in the experiences of teachers with disabilities located across different developing economies.

Research approach

A qualitative survey design was adopted for this study. Initially, one-to-one semi-structured on-line interviews were undertaken with the participants. After an initial analysis of the data, a focus group was organized for validation of emerging themes and additional probing. The interviews covered the following areas: Motivation for becoming a teacher; identity as a teacher; and experiences with others, such as students, colleagues, parents and so on.

In total nine individuals signed up to take part after seeing a call for participants on WhatsApp groups, Twitter, or other circulation lists. All participants signed an e-consent form to ensure that they had understood the purpose of the research and the nature of engagement. At the end of the data collection, participants were offered a small contribution toward the cost of mobile data usage. All the data were transcribed, and analysis was undertaken to identify overarching themes (Neuman, 2013).

As noted earlier, the aim was not to undertake any comparative analysis, but to identify overarching themes and patterns.

Note on anonymity

Anonymity was discussed with participants, and they were given the option of using their first name or a pseudonym. After some discussion, four teachers; Joseph, Veliswa, Ashok, and Arjun wanted to be identified by their names, while the other five asked for a pseudonym to be used. This has been respected in the reporting of the data here.

Table 1 provides an overview of the participants.

Official documents: an overview

Through an online search, focusing exclusively on official education policies (available in English) of the four selected countries, an attempt was made to understand if teachers with disabilities were visible in these texts. Table 2 highlights key insights emerging from this search.

Thus, official texts varied in their mention of and emphasis on teachers with disabilities, with no specific efforts shining through. None of the official documents had any well-articulated vision around the recruitment and role of teachers with disabilities.

Findings

Reasons for becoming a teacher

In examining the reasons participants gave for becoming a teacher, three factors emerged: (i) passion for teaching; (ii) belief that it was a good or suitable job; and (iii) lack of opportunities to access other jobs. Across all four countries, seven teachers, Joseph, Mary,

Table 1 Participant overview.

<i>First name</i>	<i>Country</i>	<i>Sex</i>	<i>Age</i>	<i>Disability</i>	<i>Highest level of education completed</i>	<i>Completed formal teacher training?</i>	<i>What level is the school?</i>	<i>Years as a teacher</i>	<i>Years as an English teacher</i>
Joseph	South Africa	Male	56	Physical	Undergraduate degree	Yes	Secondary school	15	7
Veliswa	South Africa	Female	49	Physical	Undergraduate degree	Yes	Secondary school	26	20
Jacob	Rwanda	Male	29	Physical	Secondary school	Yes	Primary school	3	3
Mary	Rwanda	Female	39	Visual	Undergraduate degree	Yes	Secondary school	Unemployed at time of interview	N.A.
Gabriel	Rwanda	Male	35	Physical	Undergraduate degree	Yes	Inclusive school	9	9
Arjun	Nepal	Male	33	Mental health	Master's degree	Yes	Secondary school	9	9
Ashok	India	Male	37	Visual	Master's degree	Yes	Primary school	14	14
Sania	India	Female	37	Physical	Master's degree	Yes	Secondary school	8	8
Ankur	India	Male	64	Physical	Master's degree	Yes	Secondary school	32	32

Ashok, Sani, Jacob, Gabriel, and Arjun, spoke about teaching as their vocation or passion. They noted their affinity for working with young people or being interested in teaching from a young age. Joseph (South Africa) underlined teaching as being a “calling” due to it “not having any incentives at all; it has very little pay at the end of the month.” Similar sentiments were expressed by Sania (India) who described how teaching was a “huge responsibility” connected to the progress of a country with teachers being the “creators of the future.”

Ankur (India) and Jacob (Rwanda) viewed teaching as a more suitable profession for a person with disabilities due to the lack of “tensions” related to disability (Jacob). Ankur declared that 32 years ago when he became a teacher, “the job of a teacher was quite comfortable, no challenges, go to school, come back home at the right time” and so it was a good job for someone with a physical disability like him. In addition, parental views about teaching being a respected job was also a factor in Ankur and Veliswa’s decisions to choose the profession.

Both South African participants, Veliswa and Joseph, had chosen to become teachers due to the lack of access to other jobs. For example, Veliswa wanted to become a social worker but when she did not get a place at university her parents applied on her behalf to a local teacher training college.

In explaining why, they decided to specialize as English teachers participants highlighted three main reasons: Personal enjoyment and ability in the language, belief in the importance of the language, and job availability. Six teachers from all four countries, Sania, Arjun, Jacob, Gabriel, Mary, and Joseph, noted their enjoyment of the English language and their ease and ability in the subject while studying as an important factor in specializing as an English teacher. Other reasons highlighted were the fact that English is a “global language” and hence it is important for young people to know, it made access to higher education feasible and also prepared young people for the workforce. Additionally, some spoke of the enhanced status that being an English teacher provided. For example, Ashok (India) reflected that “if you have command over English, then there is demand for you in the whole world.” Expressing similar sentiments Ankur (India) argued that if a person speaks English, then society thinks that “he comes from a noble family, he is a very knowledgeable person, a very smart person, a very powerful person.” This was also echoed by Joseph in the South African context. Mary (Rwanda) was the only one who noted difficulties in finding a job.

Teacher identity

During the interviews, across the participants, it was interesting to observe that they underplayed their disability when talking about themselves as teachers. Rather, participants focused on traits such as “hard working” (Mary), being accepted by colleagues and as capable professionals.

Sania reflected that her perceptions about her abilities changed after becoming a teacher:

Before becoming a teacher, I was a student, and my thinking was very backward and now it has developed as I have studied more. Even my thinking about my handicap has changed a lot. Earlier I used to consider myself the weakest but now I feel that things are a little okay, it does not matter.

Building self-confidence was something that was valued and discussed by most others, with Ankur (Nepal) rebutting the idea that a teacher with disabilities faced discrimination due to disability. He explained that: “respect depends on your personality, not

Table 2 Official documents making reference to teachers with disabilities.

Country	Mention of teachers with disabilities in official education specific documents
South Africa	<i>White Paper on the Integrated National Disability Strategy, 1997</i> (Office of the Deputy President, 1997): Emphasized the need for capacity building within the education sector, by acknowledging the importance of teachers who are fluent in sign language, so that they can be good deaf adult role models and create positive deaf culture in school. <i>Employment Equity Act</i> (Parliament of the Republic of South Africa, 1998): Legislated that those in a designated group, including persons with disabilities, cannot be unfairly discriminated against and states that there should be diversity in the workforce. There is no specific mention of education. <i>Draft White Paper on the Mainstreaming of the Rights of Persons with Disabilities to Equality and Dignity</i> (Department of Social Development, 2016, 112): States “parties shall take appropriate measures to employ teachers, including teachers with disabilities, who are qualified in sign language and/or Braille, and to train professionals and staff who work at all levels of education. Such training shall incorporate disability awareness and the use of appropriate augmentative and alternative modes, means and formats of communication, educational techniques and materials to support persons with disabilities.”
Rwanda	<i>Law No1 Relating to Protection of Disabled Persons in General</i> (Ministry of Justice, 2007): Outlined specific anti-discrimination policies for people with disabilities and noted affirmative action in recruitment stating, “a disabled person shall be given greater access to employment opportunities than any other citizen in case of equal capacities or in case of equal marks in competition.” <i>Revised Special Needs and Inclusive Education Policy (2018)</i>: Highlights the importance of accessibility for both students and educators underlining a commitment to “developing conditions that are adequately conducive for all learners and educators to interact in a barrier-free and child-friendly educational environment” (p. 1).
Nepal	There was scant reference to teachers with disabilities in policies with the only explicit mention being in the <i>School Sector Development Plan 2016/17-2022/23</i> (Ministry of Education, 2016). In this plan the importance of ensuring accessible sanitation facilities in schools for “children, boys and girls, and differently-abled students and teachers” was noted.
India	<i>Rights of Persons with Disabilities Act (2016)</i>: In order to promote and facilitate inclusive education the aim is to “train and employ teachers, including teachers with disability who are qualified in sign language and Braille.” However, this explicit focus on recruiting teachers with disabilities is not noted in the national programs, such as the <i>Sarva Shiksha Abhiyan (SSA)</i> which sought to universalize primary education, had a clear focus on children with disabilities, and focused on increasing the recruitment of female teachers and teachers from tribal communities.

your physical stature and it depends on what work you do, how do you work, your behavior with others and it depends more on those factors than if you are disabled or not.”

Five of the teachers, Mary, Ashok, Ankur, Veliswa, and Joseph explicitly spoke about how they were role models for students with disabilities. Joseph explained that he felt, “... I’ve got a role to play in society as far as people with disabilities are concerned” and he pointed out that students with disabilities were more likely to be sent to his school because he worked there. Additionally, some of the teachers noted that their presence projected a positive perception of persons with disabilities to those around them. Importantly, Veliswa, Mary, and Ashok also believed that they were more capable of teaching children with disabilities because they had an increased understanding of what it means to be a person with disabilities. Joseph felt the same and made the case that teachers with disabilities were more empathetic toward children with disabilities as they shared a common identity.

Impact on pedagogy

The teachers’ experiences of disability took on more prominence in their discussions about the impact of their disability on their pedagogy and the different challenges and enablers in the school system. A few instances of their disability impacting their ability to carry out their duties as a teacher were noted. Ankur, Veliswa, Joseph, Jacob, Gabriel, and Ashok spoke about challenges in walking long distances, standing for long periods of time, or difficulties with stairs. Some of these teachers received reasonable adjustments to support them in carrying out their responsibilities. Joseph (South Africa), who had strongly advocated to his school management team on behalf of both himself and the children with disabilities, had been able to get changes made to the buildings including the installation of ramps and rails, and moving steps closer together. He also had some change in duties, for example, he was not required to undertake any sports related duties and instead had been able to set up extra-curricular debating classes which he could arrange “comfortably” from his class. Ashok (India), who had a visual impairment as well as a physical impairment, had his teaching schedule set so that he would not have to undertake teaching duties in the dark. He also spoke about receiving accessible teaching resources such as large format textbooks from the government. In contrast, though Mary (Rwanda) who was blind did not feel that her disability impacted her teaching, she was concerned about the lack of accessible material and particularly a lack of translated resources in Braille.

Not all teachers received additional support or appropriate reasonable adjustment. Unlike the teachers in India who received support with transport, Gabriel and Jacob in Rwanda, both with a physical impairment, had to walk to school leaving them tired by the start of the school day. Veliswa (South Africa), who acquired her physical impairment less than 5 years ago, had experienced being placed in inaccessible schools. One such placement, where the school did not have a ramp, resulted in her falling from her wheelchair, rendering her unconscious and being hospitalized. It was only after this incident that she was transferred to a school with more appropriate accessibility. At the time of the interview Veliswa had changed schools again and was employed in a special school which was the most accessible school she had worked in, both in terms of the building and support; for instance, she was supplied with a teachers’ assistant to help her manage the class.

As well as discussing reasonable adjustments Ankur (India) and Joseph (South Africa) spoke about the way in which they adjusted their teaching styles to accommodate challenges in standing at the blackboard. Before he became a principal Ankur used to deliver his lessons sitting in a chair and spoke his lessons rather than writing on the board. Joseph used the opportunity to focus more on group work using pre-prepared worksheets in lieu of writing on the board. Gabriel (Rwanda), who has a physical disability, noted how this could reduce his energy and so to compensate he had to plan carefully to ensure he could do everything he wanted to. He prided himself on his excellent time management and commented on how this was an important quality for a teacher with disabilities to have in order to manage their life. More broadly, challenges were noted in relation to being teachers of the English language, with a lack of access to translated resources and internet and computers in schools, as highlighted by Mary and Jacob in Rwanda. Veliswa (South Africa) noted a specific challenge in teaching English in multilingual classrooms. For example, some children in her class were from Afrikaans speaking homes, some from Xhosa speaking homes, and some had English as a first language, causing tensions among children.

Teachers from India also focused on the official certification of their disability which enabled them to seek employment, disbursements, and an additional stipend to get transport to work and access to health camps for free medical check-ups.

Engagement with colleagues

All teachers spoke highly of their colleagues and generally described having strong and supportive relationships. Sania (India), Veliswa (South Africa), and Gabriel (Rwanda) spoke about being friends with colleagues and offering and receiving emotional support. Ashok (India) and Joseph (South Africa), on the other hand, positioned themselves as being respected members of staff who were sought out by others for advice. Ashok noted that this was particularly in relation to supporting children with disabilities, while for Joseph this was usually for support in speaking English. Colleagues would also ask him to translate or ask questions on their behalf during meetings conducted in English due to his strong command of the language. Jacob (Rwanda) and Joseph also spoke about being accepted as a teacher first by colleagues rather than a person with a disability.

In discussing relationships with school management authorities, Veliswa (South Africa) raised her issue about the lack of accessibility of buildings. Jacob from Rwanda did not report any challenges with the management but noted that he worried that should he become sick due to his physical disability he might be at risk of losing his job, and that there was no protection against this.

Joseph (South Africa), Arjun (India), and Ankur (India) spoke more positively about being given additional responsibilities. Joseph had strong relations with his management team and was often assigned to chair meetings or take minutes. Similarly, Ankur who was a headteacher noted how his seniors at administrative levels were very supportive of him, enabling him to undertake professional development which included visiting schools abroad to familiarize himself with their education systems. Career progression was something which was also noted by Gabriel (Rwanda) who was now in charge of discipline at his school. On the other hand, Sania (India) noted how while promotion was a possibility, she did not feel able to take on the extra load due to her disability.

[teachers with disabilities] get many opportunities because after my post, the next promotion is for that of a school principal. As a handicap person, I cannot take up all the responsibilities that fall on the principal. I feel that if I was not handicapped then maybe I could have easily taken the post and done all the work. A teacher with disabilities can become a principal but personally, I do not want to because the principal has many responsibilities. There are no obstacles from the government, it is my choice not to take up that post.

Students

Most of the teachers related positive interactions with their students and spoke about receiving respect. Sania (India) reflected that this might be both due to her being a teacher of the English language and a person with a disability:

I feel that I am the same for them, just like all the other teachers. They do not think of me as different, but they respect me. They respect me a lot because I have problems in life and yet I continue to struggle and it's not like I have given up. I continue struggling in life and because of that they [the students] might consider me their role model ... They respect me a little more than other teachers because I teach them English. Thus, that also facilitates their respect.

While Veliswa and Joseph in South Africa felt well respected in school, they also recalled some initial challenges which had been overcome by directly engaging with students. Joseph spoke about how initially some students didn't do their homework "because they thought, forget about that disabled teacher he's not going to do anything to us." However, he explained that just like any other teacher when he first started at the school, he "la[id] down the law" and with time students' mindsets changed and he is now well respected by students. He talked about the need for promoting a culture of mutual respect as well as setting out clear behavioral rules for students. Veliswa recalled that when she returned to work after her leg had to be amputated, some of the students were "scared" and would "fold their hands, move a little bit to the back" while other students "came closer to me trying to find out, 'teacher how do you feel?'" She explained how she reassured students that she was okay and after a couple of weeks the students adjusted. Veliswa went on to share how one of the students had an uncle who was walking with the use of a prosthetic leg after his leg was amputated, and knowing this had given her comfort that she would be able to do something like that in time.

Gabriel and Jacob, from Rwanda, were the only teachers to speak about ongoing challenges with students. Jacob spoke about how some students "laugh and laugh" at him due to his physical disability and in some cases also attempt to "imitate how I am walking," and how he engages with them to change their mindset.

I try to make conversation with them, and I try to tell them that disabled people are people like them. I give them different examples of disabled people that are famous in the world and also in our country. What normal people can do also disabled people can do. They can't change my mind, but their minds are changed. I try to change it!

Similarly, Gabriel also noted how some students "laugh at me" and "turn away." However, Gabriel who was more senior than Jacob and Head of Discipline at his school, explained that this happened outside of school. In reflecting on why this kind of behavior occurs Gabriel explained that "normally they [students] don't experience people like me, teachers who are disabled, teachers who are not moving well." As with Jacob, Gabriel also explained that it was his duty to teach the young people and promote acceptance:

I normally call them. I normally say, "you come" and I show them. There are some students who are disabled, we have to sit together. We tell them there is no need to put people aside because they are disabled; we have to teach them.

Parents and the community

The teachers generally reported having strong relationships with parents. Mary (Rwanda), reflecting on her internship in a school for students with visual impairments, spoke about how a parent had told her it was "amazing" to see a blind teacher and that she was more suitable to teach his blind child because she too was blind and so had a better understanding of their needs. Joseph (South

Africa) spoke about how when he first arrived at his school some parents were slightly concerned “you could see with the body language that they think ‘can this fellow actually pull it up?’” However, he explained how this changed:

My matric results in English were very good and then I got the confidence of the parents and hence the parents were comfortable with me, and even coming to me for personal issues outside of the school.

While no teacher reported any concerns with discrimination from parents, some teachers experienced challenges with wider society. Sania (India) stated that she avoided attending any weddings and parties as she felt “different from others” and “shame.” Arjun (Nepal) spoke briefly about being discriminated against due to his mental health difficulties. He also commented that he knew of qualified teachers who “due to their physical disabilities were confined inside their house.” In expanding on this he described Nepalese society as viewing a disabled person as having “something lacking.”

Impact of covid-19

Given that the project took place during the pandemic, it became a discussion during the focus group, as teachers reflected on how this was having an impact on their professional lives.

While most teachers had remained in their permanent teaching positions throughout the pandemic, Mary (Rwanda) was laid off work, having started a temporary contract at the beginning of the pandemic. Veliswa (South Africa) spoke about financial hardship having left one teaching position during the pandemic and starting a new one only recently, leaving her without enough money to buy personal protective equipment (PPE). While these concerns were shared by their colleagues without disabilities, some participants highlighted how their disability had them feeling more vulnerable and at risk. Veliswa also spoke about the increased risk posed to teachers, and particularly teachers with disabilities, who continued to work in person. She explained that at the beginning of the pandemic, she had become “paranoid” about the virus. However, as time progressed, she has learned to live with the risk, explaining “as I learned about it all I adjusted and started acquainting myself with the protocols and how to cope and how to manage stress itself, because it was really scary.”

For the teachers in South Africa there had been a drive to enable vulnerable people to shield and take leave from work at the beginning of the pandemic. Joseph, who had an underlying health condition as well as having a physical disability, explained that he had been granted leave on full pay for 3 months in 2020. This had enabled him to work from home preparing resources while a substitute teacher took his place in the classroom.

An important theme raised by teachers in all four countries, was how the pandemic had placed additional workloads on them. The teachers reported how extended periods of school closures built up pressure in the system to do supplementary work with the students to help them catch up on their schooling. Gabriel (Rwanda) and Joseph (South Africa) explained how the extra workload was particularly challenging for teachers with physical disabilities as the increased movement between classes, as well as the pressure to teach more content in shorter times, caused more fatigue.

Discussion

Across the different country contexts, multiple evidence presented in this chapter, namely academic literature, government documents, and primary research clearly highlight efforts toward the participation of children with disabilities in mainstream school settings but do not extend to teachers with disabilities. Rather, the role and importance of an inclusive teaching workforce remains neglected.

In the final section of this chapter, I will develop three key arguments:

1. The central role that teachers with disabilities play in facilitating inclusion.
2. The need for a more systemic approach in supporting the integration of teachers with disabilities into the education workforce.
3. The important role that evidence can play in taking this agenda forward.

Facilitating inclusion

Evidence gathered across the existing literature continues to show that teachers with disabilities have an important role to play in building and fostering more inclusive school cultures. Their presence promotes inclusion *through* education, rather than simply *in* education. As Pritchard (2010, p. 41) argues, “Disabled people as educators enact exemplary pedagogic justice and socially inclusive practice.”

Teachers with disabilities feel that they are particularly able to understand, empathize and communicate better with students with disabilities (Glazzard and Dale, 2015). It can also have a positive impact on the well-being of pupils with disabilities, aiding their participation and progress through the schooling system. Additionally, Duquette (2000) notes how their presence can be particularly beneficial for fostering education success of children with disabilities by helping them challenge low expectations of

themselves as they can relate to the teachers' personal and professional paths. This notion of being a role model for students with disabilities, but also for parents of children with disabilities, resonated strongly in the evidence presented from the empirical research. By their presence as teachers, they can also challenge negative perceptions of disability present in the wider community.

Additionally, teachers with disabilities are more likely to notice acts of injustice taking place in their school settings. Evidence of frustration, and noticing the really difficult time that students with disabilities were facing in schools, was reported by autistic teachers working in the UK in [Wood and Happe's \(2021\)](#) study. Teachers with disabilities are shown to have a sense of purpose as change agents—they are compassionate, empathetic and effective educators who foster inclusion and change ([Moore et al., 2020](#)). This is particularly so as they draw on their own experiences as students, when they likely faced difficulties because of their disability, and this can motivate them to be positive agents for change.

Finally, having teachers with disabilities in mainstream settings can also act as an important impetus, in many low resource contexts, to invest in accessible teaching and learning materials. In the study presented in this chapter, teachers in Rwanda highlight this as a major barrier, while in [Lamichhane's \(2016\)](#) study teachers with visual impairment in Nepal struggled to teach certain subjects because of the lack of accessible materials. As a teacher in Lamichhane's study mentioned: "It was very hard for me to adjust to school in the beginning because I did not have access to enough books in Braille." Further, observing how it was difficult to mark students' exam papers and needing help from others the teacher goes on to note: "If I were a teacher in the school for students with a visual impairment, I could easily check those papers, as they would be in Braille" (p. 26). It could therefore be argued that having more teachers with disabilities as part of the workforce would provide additional impetus to invest in teaching and learning materials which were inclusive of diverse needs.

Systemic efforts needed to increase participation and retention of teachers with disabilities

Experience and insights from many countries suggests that teachers with disabilities working in an education role in schools face several impediments to their effective and successful employment in the sector. For example, in Wood and Happe's work with autistic teachers in UK they noted the lack of understanding and support in school communities about the need of this teacher group. [Tal-Alon and Shapira-Lishchinsky \(2020\)](#) in their interviews with headteachers who were employing teachers with different physical disabilities revealed the many ethical dilemmas they faced between valuing inclusion while also being concerned about student and staff wellbeing. For example, headteachers commonly noted their concerns that employing teachers with disabilities is a burden when they consider frequent absenteeism. They found themselves "torn by their responsibility to the teacher with the disability on the one hand, and to the other teachers on the other" (p. 10). The dilemma around the notion of students "paying the price" (p. 11) was another significant conflict. The authors conclude that even though there is recognition of the value of employing teachers with disabilities, these dilemmas "reflect the commitment to inclusion not only as an ideology but also a practice" (p. 13) and that more needs to be done to provide school principals with regulated information, sources on accessibility adjustments. These findings are very similar to those by [Ware et al. \(2021\)](#) who noted that in the absence of awareness of official policies and regulations in school management can result in the needs of teachers with disabilities being neglected. Thus, clearly framed and widely publicized official mandates are essential in ensuring that teachers with disabilities are adequately supported in school settings. Encapsulating some of these ideas Veliswa, reflecting on the South African context, noted that the White Paper C (ref?), "which is about inclusivity. This includes only learners but not teachers, so that needs to be looked at."

A common theme that emerges from various studies in the field is the lack of adequate support given to trainee teachers with disabilities, particularly when undertaking teacher training programs. This seems ironical given that many teacher training programs now advocate for the need for inclusivity in teachers, however, they fail to provide adequate accommodation to teacher candidates with disabilities as the trainers themselves fail to take account of the specific needs of this group of trainees ([Bargerhuff et al., 2012](#)). Ensuring training courses are inclusive in terms of trainee accessibility, course content, and trainers, ITT courses should be accessible to people with disabilities and other marginalized groups.

Given the very low participation rates of persons with disabilities in higher education in many developing economies raises issues of the likelihood of future employment opportunities in the education sector. However, as the [Education Commission \(2019\)](#) report suggests that "New approaches are needed to ensure routes into teaching are accessible for underrepresented groups. Traditional routes are often inaccessible to people with disabilities and people from minority groups. Alternative routes could facilitate greater representation." While it is unclear what these new approaches might be, there is a case for thinking more creatively and inclusively about how the participation of persons with disabilities can be increased within the mainstream education workforce. An essential element of this will be to ensure that there is greater dialogue between different stakeholder groups to enable a deeper appreciation of the kind of support needed by teachers with disabilities, and the value that they bring to the culture of the classroom.

Advocating for change through robust evidence

Very little attention is being given to the role and participation of teachers with disabilities within research on inclusive education. This neglect has a multitude of consequences, including little understanding of the lived experiences of teachers with disabilities, and perpetuating a lack of appreciation of their important role in implementing the inclusive education agenda. There is a lack of knowledge of their rates of participation and how these intersect with gender, ethnicity and location, all of which can provide insights into how to address their low levels of participation in the education workforce.

The World Report on Disability (World Health Organization, 2011) categorically stated that the existing “lack of data and evidence ... often impedes understanding and action in the field across various sectors, including education” (p. 263). As its final recommendation the report notes the “need to strengthen and support research on disability” (p. 267). This message also resonates in Article 31 of the CRPD (UN, 2006) which states that research is central to addressing discrimination, changing perceptions, and combating stereotypes and prejudices.

Robust national datasets, as well as in-depth qualitative research elucidating the experiences of teachers with disabilities, has the potential to contribute to both the policy and practice praxis. Subject specific research, as well as intersectional research examining how ethnicity, religion and sexuality intersects with disability, is needed to understand how different dimensions of teachers’ identities interact with disabilities and affects their experiences and inclusion within the workforce.

Additionally, it is useful to be reminded that “good research ... will not on its own change the world. It needs to be accompanied by sophisticated and strategic activism” (Swartz, 2014, p. 5). This is something that was strongly felt by participants in this research study too. As Joseph (South Africa) succinctly argued:

Disabled people have stigma attached and we have become objects of pity. Especially in this part of the world people say “Ahh do you think he can do something worthwhile? Is he worth listening to?” That mindset has got to change, especially in our part of the world. I think we need to be out there, say whatever we have to say, not preaching but putting across what we believe in and making sure we are counted among the able bodied.

Albert and Harrison (2005) make a very useful distinction around how researchers “should be ‘on tap’ not ‘on top’” (p. 8). In addition to this “on tap/on top” distinction, Singal (2019) adds the “on shelf” distinction, suggesting that research which is left on the shelf and accessible only to a few is not worth pursuing. Meaningful research that can support the inclusion of people with disabilities in various life spheres is needed. The role of research in fostering change can no longer be undermined or overlooked, but there continues to be a need to make sure that research (and researchers) is respectful of people and their contexts, while being rigorous in gathering evidence. The role of teachers with disabilities as being agents of change is one which can no longer be neglected within the wider discourse on inclusive education.

This chapter makes a strong case for examining more closely and investing more systematically in developing an inclusive and diverse education workforce, specifically promoting the inclusion of teachers with disabilities in mainstream education systems.

Glossary

Aotearoa Aotearoa is the Māori name for New Zealand

Māori Indigenous people of Aotearoa New Zealand

Narrative assessment a credit-based, narrative approach to assessment for disabled students that is accessible to teachers, families and students

Rangatahi – young person in Māori culture.

Te reo Māori Māori language

Whānau extended family group that includes physical, emotional and spiritual dimensions

Kura school, education, learning

Introduction

In this chapter we argue that student belonging and learning are enhanced when assessment in education is understood as the starting point for thinking about approaches to teaching and learning, and as a partnership between students, teachers and families. All three authors of this paper are involved in teaching and learning about a particular sociocultural approach to assessment, known in New Zealand as *narrative assessment*. Our wider interest is in equity and inclusion, and in collaborative research that supports the development of inclusive school communities. We draw on a two-year collaborative research project in two New Zealand secondary schools and a special school where researchers, teachers, students and families worked together to recognize, describe, report on and respond to disabled students' learning in affirmative and accessible ways.

Making good decisions about the future of our schools relies on a shared understanding about what inclusion means and why it is important. While recognizing that the terms inclusion and inclusive education are dynamic in their meaning and dependent on local context, we draw on a rights and evidence-based interpretation that also considers how teachers enact inclusive pedagogical practice (Ainscow and Messiou, 2018; Florian, 2014; Slee, 2018). Roger Slee's think piece prepared for the 2020 *Global Education Monitoring Report* asks what kind of society we want to live in, and poses three questions that are integral to the transformation of our education system toward inclusion:

What kind of world do we want our children and young people to live in?

What kind of schools and classrooms are required to achieve that world?

When we look at our schools – who is in, who is out, who decides and what are we going to do about it?

Slee (2018, p. 9).

We recognize that inclusive education is, as [Slee and Tait \(2022\)](#) note, “a rebellious challenge to oppression in and through education” (p. 2) that is contingent on time, place, political economy and culture and demands far-reaching transformation. Without wishing to lose this “insurrectionary zeal” these authors opt to apply guiding principles that position inclusive education as a process that, in practical terms, increases access to and ensures presence, participation and success (academic and social) for all children and young people in their neighborhood early childhood center and school. A central message is that every learner matters and matters equally ([United Nations Educational, Scientific and Cultural Organization, 2017](#)). Children’s rights to quality education in their local regular school are guaranteed, and to uphold these rights neighborhood schools take a principled approach, building their capacity to teach all students, eliminating barriers to belonging and success, and enacting inclusive values such as equity, participation, rights, respect for diversity, community and sustainability ([Ainscow and Messiou, 2018](#); [MacArthur and Rutherford, 2016](#); [Rutherford, 2016](#); [Slee, 2018](#)).

The *Using narrative assessment to support secondary school teachers’ inclusive practices project*, used a Disability Studies in Education (DSE) framework to explore the impact of professional development about narrative assessment on teachers’ pedagogy and practice, and on students’ learning and social experiences. This chapter illustrates how DSE can support research based on a curiosity about the dilemmas teachers face in the process of teaching and learning, as opposed to locating learning challenges as problems or deficits within students that require “fixing”. We have used a DSE and sociocultural framework to examine the social and cultural context in which children learn in secondary school settings, and to pay attention to how teachers and families can collaborate to understand students, their capability, their learning and how that learning is assessed.

Drawing on the experiences of one school in our research we turn attention to the importance of starting with assessment and show how assessment capable teachers and students can drive quality teaching and learning. Collaboration within the school community is an essential element in this process, with narrative assessment shifting thinking from assessment as focused on the individual student to assessment as partnership among teachers, students and families that takes place across multiple contexts in the life of the student.

Context for this chapter

The research on narrative assessment in secondary schools drawn on in this chapter was carried out in Aotearoa New Zealand (Aotearoa). Education is compulsory from ages 6 to 16 and most children, including disabled children, attend their local, public school, funded by the government, where attendance is free. At secondary level students may be able to choose between single sex or coeducational public schools, secondary schools in rural areas are more likely to be co-educational and serve a wide geographical area. Most secondary schools are state schools, about 10% of students attend “integrated” state schools which are usually designated as having a special character, such as a particular religious affiliation, or education approach. Less than five percent of children attend private schools that are not government funded, fees are charged for children’s tuition and private schools do not have to follow *The New Zealand Curriculum*. Some students also receive support from The Correspondence School, Te Aho o Te Kura Pounamu, which uses multimedia and online learning. Twenty-seven separate day special schools are designed for disabled students from Years 1–13 who are thought to have “a high level of need”, students can enroll in these schools under a Specialist Education Agreement.

In Māori-medium schools some students are taught curriculum subjects in Te Reo Māori for at least 51% of the time. Kura Kaupapa Māori schools are a unique New Zealand primary school education system in which children are immersed in a Māori language and cultural environment with the aim of enabling graduates to “live as Māori”. They are state schools where teaching is in te reo Māori and is based on Māori culture and values, they follow the curriculum for Māori-medium teaching, learning and assessment, Te Marautanga o Aotearoa, and cater for students from years 1 to 8 or years 1 to 13 ([Ministry of Education, 2017](#)).

A key policy document that guides teachers’ and schools’ practices is the *New Zealand Curriculum* ([Ministry of Education, 2007](#)), which covers subjects that are taught at primary and secondary levels and specifies the standards students should reach by subject. The document clearly states that it is for all students; participation, learning, achieving and belonging for all students are central concepts. The purpose of assessment is described as “... improving students’ learning and teachers’ teaching as both student and teacher respond to the information that it provides” ([Ministry of Education, 2007](#), p. 39). However for disabled students who may be considered to be learning long-term within Level 1 of the curriculum, assessment has often been associated with a diagnosis or application for resources. Many teachers, in both local and special schools, have considered the *New Zealand Curriculum* to be irrelevant for some students ([Guerin, 2015](#); [Morton et al., 2012](#)) and may therefore struggle to see themselves as teachers of all students or to see all students as capable learners ([Florian, 2014](#); [McIlroy, 2017](#)).

The National Certificate in Educational Achievement (NCEA) is the national senior secondary school qualification which assesses student achievement in the last three years at school. It is a standardized process which means students can move between schools and regions and continue working toward their NCEA qualifications. NCEA is recognized by employers, and is used for selection by universities and polytechnics, both in New Zealand and overseas. We have noted in an earlier publication, however, that NCEA also creates structures that determine how schools operate, some of which may exclude disabled students (Morton et al., 2021). NCEA measures specific skills (in literacy and numeracy, for example) that may not reflect the learning and strengths of some students. We have posed a number of questions about assessment for all, noting that school should be a place where students can recognize their capability, believe their dreams can be achieved, and have the skills and motivation to continue learning beyond school. When students feel that their learning is neither recognized nor valued, their identity and confidence as a learner is at risk, and on that basis we have asked:

So how can schools respect student diversity when the assessment system values only one narrow interpretation of excellence? What does this mean for students who may not achieve at the standard required to 'succeed' using this system? How do we recognise achievement for some disabled students whose learning and progress are invisible within NCEA school achievement data? How do we respect diversity in teachers and students when assessment benchmarks determine teaching content?

Morton et al. (2021, p. 10).

It is within this space that we undertook the *Using narrative assessment to support secondary school teachers' inclusive practices* project. Narrative assessment is a credit-based narrative approach that documents learning for disabled students who are considered to be working long-term in Level 1 of the *New Zealand Curriculum*. It uses a combination of photographs and/or videos of students' learning experiences alongside narrative descriptions that connect with the curriculum's key competencies and learning areas. Importantly, learning is described in affirmative ways that are accessible to teachers, families and students to ultimately enhance student belonging and learning at school, home and in the wider community (Ministry of Education, 2009a,b).

DSE as framework for rethinking research and teacher professional learning about assessment and pedagogy

The *Using narrative assessment to support secondary school teachers' inclusive practices* project began with questions from teachers and principals about how to recognize and report on the learning of disabled secondary school students. The project was funded through the Teaching and Learning Research Initiative (TLRI) and explored the use of narrative assessment to support secondary teachers' inclusive practices. Funding for TLRI projects is conditional on a model of partnership between researchers and educators (<http://www.tlri.org.nz/tlri-research/research-progress/school-sector/using-narrative-assessment-support-secondary-school>).

The project built on an earlier research and professional learning project funded by the New Zealand Ministry of Education which introduced narrative assessment to a group of teachers, parents and academic staff in a collaborative learning community (Morton et al., 2012). This earlier research sparked our interest in making greater use of DSE to explain shifts in understandings and practices and to focus on the relationships between cultures of learning and cultures of belonging (MacArthur et al., 2018; Morton, 2014; Morton et al., 2019).

DSE supports a focus in research on problems in teaching as professional dilemmas

Teacher education and professional learning is central to the project of supporting education communities to develop inclusively, challenging those working in initial teacher education and ongoing teacher professional learning to think carefully about the nature and form of such learning. What it means to deliver high quality inclusive education training in teacher education for teachers either entering or already working in the profession remains unclear (Florian and Camedda, 2020), although studies from a range of national contexts highlight that while teachers are generally committed to the values and principles of inclusive education, they are often anxious about how to work with an increasingly diverse range of learners, believing they lack the necessary "specialist" skills and knowledge (Black-Hawkins, 2017).

Black-Hawkins argues that such views can undermine teachers' professional confidence while also casting doubt on traditional pedagogical approaches to inclusion that are based on planning and teaching for "most" learners, while providing something extra or different for "some". The "some" are often those students who have been labeled and categorized as "special needs", a construct that supports a deficit model of learning by locating the "problem" in the learner (who requires "fixing"), rather than encouraging an exploration of the learning context (Florian and Black-Hawkins, 2011; MacArthur and Rutherford, 2016; Rutherford, 2016; Rutherford and MacArthur, 2018). DSE scholars have drawn attention to the pathologizing effects of such practices on students and their families (Paugh and Dudley-Marling, 2011; Valle and Connor, 2011a).

Colleagues in Aotearoa have described the same deficit pathologizing aimed at Māori (indigenous peoples of Aotearoa New Zealand) students and their whānau (extended family in Māori culture) who have been blamed for their perceived failure within the education system (Morton, 2015). These authors argue for a reconnection of culture, identity, values and beliefs to our educational practices and argue that *relationships* are central to all students being able to participate and flourish in classrooms and schools (Berlyman and Woller, 2013; Bishop et al., 2003; Bishop and Glynn, 1999; Macfarlane et al., 2012). Morton (2015) invites us to

consider that relationships between teachers, students and students' whānau are only possible when teachers work at knowing their students and poses the question: how do our current beliefs and practices in curriculum, pedagogy and assessment support or get in the way of forming meaningful relationships with students?

Within the context of these relationships, Florian and Black-Hawkins' (2011) work on inclusive pedagogies further encourages teachers to view difficulties in learning not as deficits within children but rather as dilemmas and professional challenges for themselves as teachers (Black-Hawkins, 2017; Rouse and Florian, 2012). Their concept of transformability is a reminder that teachers' relationships with children and young people can be built on an understanding that capacity to learn can change and be changed for the better as a result of what teachers do in the present. Transformability provides a tangible way for teachers to "recognize their capacity to teach all learners" (Rouse and Florian, 2012, p. 17).

In reviewing research on the development of inclusive classroom practices, Black-Hawkins (2017) suggests that to be useful for teachers, research needs to take account of the complex interactions intrinsic to daily classroom teaching and learning. There are implications for researchers to also engage in learning partnerships, learning with and from teachers to understand inclusive pedagogical approaches that are meaningful to teachers. A DSE perspective sits comfortably with this position because it emphasizes making sense of constructions of disability and competence in education, including in teaching practice (Macartney and Morton, 2013; McIlroy and Guerin, 2014; Morton et al., 2021, 2012). DSE provides a valuable framework for research that is based on a curiosity about the dilemmas teachers face in the process of teaching and learning. It heightens alertness to the barriers to participation and learning faced by children and young people, including approaches that locate learning challenges as problems/deficits within students that make it difficult for whānau, teachers and others to effectively nurture children's learning journeys (Guerin and Morton, 2015; Macartney and Morton, 2013; Skidmore, 2002). The present project was therefore framed as a shared inquiry into a shared concern (Grudnoff et al., 2019), with DSE underpinning a commitment to value all voices and ensure all project members contributed ideas that shaped the research direction (Goodley, 2013; Valle and Connor, 2011a).

DSE encourages an examination of the social and cultural context in which children learn

DSE also recognizes that the social construction of disability as a deficit or problem within the child or young person can be challenged by sociocultural forms of teaching, learning, and assessment (Macartney, 2011; Macartney and Morton, 2013; McIlroy and Guerin, 2014; Morton and McMenamin, 2011; Morton et al., 2012). Narrative assessment, the focus of our research with secondary school students, their teachers and whānau, is one such example. Sociocultural understandings about children and young people's learning turn attention to the social and cultural context in which learning takes place, and to the relationships and interactions between people that shape our knowledge of the world and our common ways of understanding it (Macfarlane, 2015). Teachers are part of this context, how they understand students and their capability, as well as the opportunities they create for students to show their understanding and competence and for how that learning is assessed (Guerin, 2015; Guerin and Morton, 2015; Valle and Connor, 2011b; Wansart, 1995). Black-Hawkins (2017) reflects on this point:

What children 'are' and how they are 'different' from each other cannot be read off from a list of characteristics. Instead, it emerges from the interactions amongst children, and between them and their teachers, as they work together in particular educational contexts, on particular tasks and priorities (p. 16).

If schools are to become more responsive to diversity, the curriculum and approaches to assessment, teaching and learning need to be inclusive of and relevant to the lives of all students, brought to life over time in the relationships that are built up between the teacher and a group of students. Both DSE and sociocultural theory encourage an affirmative orientation by teachers that views the starting point as the present state of students' knowledge and understanding, their culture, capability and interests. Teaching builds a bridge between what the student knows how to do independently and the new level of understanding and proficiency that lies within their reach to achieve with the support of the teacher and peers. Macfarlane (2015) describes this process as a dynamic and interactive social and learning relationship, not one of fixed dependency. Inclusive approaches to teaching recognize, reflect and celebrate the human diversity found in school communities, supporting shared learning experiences and the joint production of knowledge. As we have worked in partnership with teachers of disabled secondary school students, a central aim has been to broaden the range of modes of student response that are sanctioned within the curriculum and assessed as valid learning. In this way, the rich range of knowledges and ways of being that children and young people bring to school are valued as assets and strengths to be built upon (Morton et al., 2021).

The problems of traditional individual and individualizing approaches to assessment

The history of assessment in relation to disabled people has focused on identification, diagnosis, intervention, allocation of resources and placements for services, including institutionalization. Within DSE, Paugh and Dudley-Marling (2011) have described how the "unrelenting focus" on the individual continually reinvents and reinscribes deficit views of individual students, at the same time pathologizing both students and their families.

In the UK project *Learning without Limits* Swann et al. (2012) observed an education climate where teachers were required to use the certainty of prediction as a tool in their planning and teaching (i.e., what do we expect this child should be able to/will learn?). The curriculum specified targets, levels, objectives and outcomes that meant teachers were *required to behave as if all children's potential is predictable and their futures are knowable well in advance*. Teachers felt that what they did in the classroom would have only limited impact on the lives of the children and young people they were teaching. Closely associated with this view of learning as linear, measurable and quantifiable, was "... an equally damaging view of the children who do the learning who can themselves be known, measured, and quantified in terms of so-called fixed ability, a fixed, internal capacity, which can be readily determined" (Swann et al., 2012, p. 1).

Curriculum, pedagogy and assessment are intricately linked. Assessment impacts on teaching, and Guerin and Morton (2015) argue that curriculum and pedagogy can only be transformed by also transforming the way learning is assessed. The way teachers understand and assess student learning shapes the way they think about and carry out the act of teaching, when the scenario is overwhelmingly negative, the impact is not only on the child or young person's learning, it is also on their friendships and their sense of identity. In other words, if I do not see you as a learner, I cannot see myself as your teacher.

Guerin and Morton (2015) describe a similar climate in Aotearoa to that observed by Swann et al. (2012) in the UK, in which teachers can come to hold narrow views about the potential of some children and young people to learn:

They may question how some children and young people can possibly participate in a curriculum that sets out a sequence of levels of learning objectives- a sequence that makes it look as if it is only possible to participate in the 'upper levels' having demonstrated competence in previous levels. Some teachers may also doubt their ability to be teachers in relation to children and young people who are not recognised as learners (p. 72).

The consequences of this approach can be highly detrimental for the student and their whānau who are much more likely to view their family member as capable, and has having strengths and interests that are celebrated at home and in the community.

In New Zealand, ground breaking work in early childhood curriculum by Margaret Carr and colleagues has directly challenged traditional psychological and developmental ways of framing individual learning (Carr, 2009; Carr and Lee, 2012; Cowie, 2009; Cowie and Carr, 2009). Turning to sociocultural perspectives on learning moves the focus from the individual to the individual in context, to learning as a social activity. Understanding early childhood centers as learning communities frames all members as learners, including the adults in the settings. The narrative assessment projects have similarly framed classrooms and schools as learning communities, with all members as learners.

DSE has also turned our attention to the importance of seeing assessment as a critical starting point in teaching, in the sense that it is assessment capable teachers and students who drive quality teaching and learning. Equally importantly, assessment is understood as taking place not just at school, but across the many contexts that a student participates in including their home and the wider community. Sociocultural forms of assessment privilege interactions within and between social and cultural contexts, rejecting fixed notions of medical abnormality or deficit that traditional assessment approaches are based on (Biklen and Kliever, 2006; Macartney, 2011; Morton and Guerin, 2017). In this view, impairment is no longer regarded as a singular or fixed identity, a permanent measure or predictor of capacity.

Guerin and Morton (2015) reflect on accounts from families describing their child as doing something that they believe should be celebrated, but their recounts are dismissed as not providing evidence of learning or accomplishment. They ask the reader to consider the child's and family's sense of belonging at school when learning is viewed in narrow, prescriptive ways, arguing instead that responsive and reciprocal relationship among teachers, students and whānau are central to all students being able to participate, show their learning and flourish at school. This requires that teachers work at knowing their students, a point that is illustrated in the following narrative assessment case study.

Partners in pedagogy: a narrative assessment case study

This case study comes from the *Using narrative assessment to support secondary school teachers' inclusive practices project* and illustrates how student belonging and learning are supported when assessment in education is a *partnership* between students, teachers and families, and is the *starting point* for thinking about approaches to teaching and learning. Names of people and places in this case study are pseudonyms.

At the center of this case study is Anna, a teacher in a day special school; Ria, a student aged 15 years and her whānau, and the school principal. The research this case study was part of included two local secondary schools and a special school. We have chosen this example from the special school for two reasons. Firstly, this is a school that wanted to know how they could use the *New Zealand Curriculum* to guide and document their students' learning in affirmative and meaningful ways, and how narrative assessment might more broadly inform their teaching pedagogy. Secondly, the example illustrates the process of teachers coming to know Ria, of becoming assessment-capable partners with Ria, her whānau and other teachers. The context could equally be a local secondary school, so we can also consider whether and how Ria's capability as a poet and writer might be recognized and celebrated, her learning and belonging fostered in that setting.

Anna is focused on developing her teaching pedagogy so the capabilities of all rangatahi (term meaning young people in Māori culture) in her class are visible and enhanced. Ria is a rangatahi in Anna's class. The partnerships, though interconnected, are considered separately as follows:

- Anna and research
- Anna and Ria
- Anna and Ria's whānau
- Anna and school management

Anna and research

The motivation for Anna to join the narrative assessment research project was a challenge in her teaching practice that she really wanted to grapple with, and the research provided an opportunity for collective reflection and shared learning. Anna recognized that, for some disabled rangatahi, learning progress may take time, and achievement may be demonstrated in unexpected contexts and in surprising ways. Anna recognized the learning in her class but did not think she fully captured the complexity of the interactions between teaching and learning in assessments.

All the rangatahi in Anna's class have personalized sophisticated technological support to communicate their thinking and to enable them to make best use of the senses. For example, some have cortical vision impairment and need materials presented in very specific ways so they can process the visual stimuli they experience. All of the rangatahi in Anna's class can only access the *New Zealand Curriculum* with high levels of support. This does not mean they are not capable. Some people believe that children who need high levels of support cannot learn and some educators lack confidence to teach all rangatahi. These rangatahi may then be excluded from the rich curriculum available to their non-disabled peers. When rangatahi are not taught curriculum content, standardized curriculum assessment tools can become irrelevant. This cycle is difficult to break, for assessment drives teaching and without good knowledge of children's skills and capabilities, planning a meaningful learning program is problematic.

Often school goals set for disabled rangatahi with high and complex needs are based on key competencies, not on the learning areas of the Curriculum. Key competencies in the *New Zealand Curriculum* include thinking; participating and contributing; using language symbols and text; belonging; and managing self. These are not intended as stand-alone teaching goals, but are integral to learning in the learning areas (such as, literacy; science; physical education and health; numeracy) (Hipkins, 2009). For example, a child may have a goal related to how long they spend in a science lesson, but not a goal about the scientific content that connects the child to teaching subject content.

Anna recognized the significant progress her rangatahi were making in the learning areas; however standardized assessment processes such as NCEA or e-asTTle (an online assessment tool developed to assess students' achievement and progress in reading, mathematics, writing, which begins at level 2 of the *New Zealand Curriculum*) were not accessible for the rangatahi in her class. Nor did they capture the learning demonstrated. Anna noticed a disconnect between the Curriculum vision and some assessment processes. She recognized that the complexity of teaching did not always link to planned objectives and assessments. Sometimes learning objectives require multiple experiences over time to be achieved. Sometimes very small steps toward a larger goal are achieved, and these steps may not be easily recognized. Sometimes the planned lesson goes in a different direction and very significant unplanned learning achievements are noticed but not always validated.

Anna had begun to explore the narrative approach to assessment in her postgraduate studies. Developing a deeper understanding of assessment theory is important to her as she develops and implements her teaching philosophy and feels confident to take risks, be creative and implement change in her classroom. Anna's connection to research made her an early adopter of narrative assessment theory and a thoughtful practitioner as she applied her learning to her classroom practice. A commitment to study also supported Anna's motivation to critically reflect on her teaching and constantly refine how she recognized progress and achievement (Grudnoff et al., 2019).

Anna's teaching philosophy is based on democratic principles where all rangatahi are equally valued and are partners in learning. Anna said:

I run my classroom in a democratic way. It's student driven based on students' rights; and the students plan their own learning journey. My focus is on their rights to be heard, to play, to socialise, to be educated and to be respected.

She describes herself as a facilitator of learning. Her classroom program is built around the interests and strengths of the rangatahi, which are interwoven in the learning areas of the *New Zealand Curriculum*. In Anna's classroom, teaching, planning and assessment are collaborative and inclusive of all rangatahi (Alton-Lee, 2003). For example, the class had all indicated music as an enjoyable subject. Anna gave each class member the opportunity to choose a favorite piece of music or a song, which was shared with the rest of the class. This meant every student experienced the variety of music selected, meaning all choices were validated and everyone had the opportunity to learn something about their classmates.

Anna and Ria

Anna's democratic approach to teaching means she partners with her rangatahi to learn with and give value to their strengths, interests, and perspectives about their learning. The partnership focused on here is between Anna and Ria. At the time of the research project, Ria is beginning her journey through secondary school and Anna has been her classroom teacher for 2 years. Ria uses a wheelchair for mobility. She communicates in ways other than speech and uses a PODD (Pragmatic Organization Dynamic Display), a high tech communication tool based on using visual discrimination to communicate a message. Additionally, she uses head movements to indicate yes or no and facial expression to communicate emotion.

Anna shared Ria's whānau's belief that, "Ria has much to say, has firm opinions and is keen to share her thoughts both at home and at school". She recognized that her role as teacher was to ensure Ria had effective, accessible communication systems to enable her voice to be heard. Without a deep knowledge of Ria and a genuine connection with her, Anna felt unable to fully respond to Ria's motivations and best enable successful learning as a valued class member belonging in the *New Zealand Curriculum*. The curriculum's vision is for "young people who will be competent, connected, actively involved, lifelong learners" (p. 7), and this vision guides all Anna's pedagogical decision-making.

An example of partnership in learning that built on Anna's deep knowledge of Ria is visible in physical education. Ria has never been an enthusiastic participant in this learning area and had frequently expressed her opposition to participate. However, Ria is a Harry Potter fan, and indicated to Anna that she wanted to play quidditch. Ria helped write the class "Quidditch Game Rules", and with support from a broader team the context was created so all class members could play the game. Participation was enabled by ramps so the wheelchairs could navigate the quidditch court; balls that made a noise so rangatahi with a cortical vision impairment could see the ball and large clear targets. Anna reported that Ria's face "lit up" when she saw the quidditch court and that she was totally involved in all aspects of the game which turned out to be a fierce competition. Ria's participation and learning in physical education was presented in a narrative assessment. The narrative provided the approach to share the learning outcomes of the Quidditch Game, and made visible the collaborative planning, Ria's voice, the ongoing interactions, the successes, and Ria's reflections. At home after the game, Ria used her PODD to tell her whānau that she "loved quidditch" and the game was "exciting" and "fun".

Ria's skills as a poetry writer were also revealed through partnership and recognized through narrative assessment. During an English lesson, all rangatahi were enabled to express their thoughts in writing. The focus was creative writing about a topic or person of interest. Anna holds high expectations of all her rangatahi, believing that with support creative writing is achievable. Using a range of communication supports, Ria indicated she wanted to write a poem. Ria selected a title, the vocabulary she wished to use, the order and structure of the poem, and how it was to be presented. This did not happen in one lesson but was completed with perseverance over time, supported by Anna. On completion, the poem was printed in large font on a background that enabled Ria to see the text. Ria asked that the poem be mounted on purple card and showed great pleasure in seeing the published poem she created and later shared with her whānau.

The narrative approach to assessment makes visible the relationships that support learning (Guerin, 2015; McIlroy, 2017). The personal connections mean teachers notice the interactions and small successes that grow to build a picture of capability and achievement. Anna said:

Summative assessment wasn't showing capability and wasn't showing the small successes and the big successes my class were making. Most of our class learn for a long time in level 1 (of the *New Zealand Curriculum*) and those little successes build up to become huge successes and we can show that through narrative assessment.

She described narrative assessment as a process that highlighted relationships in learning and supported her reflexivity, noting that "narrative assessment enabled me to delve deep and reflect on the learning. It's really important (that) we always presume competence and it's our job as teachers to make this visible within the NZC." She described the *New Zealand Curriculum* as "relevant for every single student because it's not prescriptive and narrative assessments are a beautiful way to capture and share learning and the curriculum".

Anna described the process of writing about the connections, the partnerships, and the progress as a joy, "Narrative assessment helps teachers to see students through a strengths-based lens, you can't see any deficits when you write narrative assessment. Their personality shines through and their strengths shine through." Knowing rangatahi strengths and building on supportive partnerships help to create a culture of care and kindness that can support joy in teaching and learning, and joy in assessing the learning and creating future learning goals (Monchinski, 2010; Noddings, 2012; Nelson, 2013). According to Anna:

Narrative assessment ... shows everyone else and Ria that we value her. Through Ria's narrative [assessment] we see her personality shine through. We can see that she is kind, empathetic, funny, generous, and clever, that she loves literacy, hates PE, and isn't a fan of maths but will give it a go, and we see it all in her narrative assessments. Narrative assessment helps teachers to see students through a strength-based lens, you can't see any deficits when you write narrative assessment. The personality shines through and the strengths shine through ... All the wonderfulness that is Ria is in her narrative assessments.

Anna and Ria's parents

The process of creating the poem was recorded in a narrative assessment and shared on Story Park—the school's electronic platform used to connect teachers, rangatahi and whānau. Ria's Mum and Dad read the narrative assessment on Story Park and said:

We didn't know she was into writing at all, particularly creative writing like poetry. We had no idea till we saw the narrative assessment and now we do writing with her at home. So we've now got her an email address and a Facebook page.

This sharing enabled Ria's whānau to support Ria's learning at home, an important element in creating meaningful connections in Ria's learning across contexts.

Ria cannot easily share thoughts about her school day. Ria's mum said of the poetry writing narrative assessment, "We can see she is valued, how she gets her own voice and her own independence." Her whānau welcomed narrative assessments that show Ria's engagement and progress, her connection with others and her capability, all made visible through teacher knowledge and skill that enables learning. Assessments that include photographs and videos capturing learning throughout the school day provide evidence their daughter is happily engaged, is recognized as a capable learner and is a welcomed member of the school community. They also describe how important it is that Ria can see her whānau enjoying the assessments, this is a tangible way to connect with her school day. Her mum described Ria as:

... so proud that we get to see a glimpse into her school world, and we get to see and extend her interests at home – merging both of her worlds together
... The connection between home and school has opened up Ria's world.

For Anna, the relationship with family means she can better understand the contexts that support wellbeing at home and use this knowledge to develop a successful school learning environment. Anna valued that families become active learning partners, drawing on an example where Ria expressed an interest in gardening at school when the class created a class garden, an experience that was shared with families. Ria's family together created a wheelchair accessible sensory garden at home for Ria to enjoy, and her engagement in this process was shared between home and school.

Anna and school management

As a classroom teacher, Anna's relationship with school management is critical to enacting a shared vision of success. Being listened to, supported, challenged, trusted, and respected all contribute to a school culture that she makes evident in her classroom. Several teachers at Anna's school joined the research project alongside Leanne, the deputy principal. The relationships among staff, between staff, and with the research team created a platform that welcomed innovative assessment processes to enhance teaching and learning. Leanne's participation and support of the research project was critical to embedding new professional learning in the school. Leanne was already on a journey to develop assessment and, as a manager, was able to actively support change, both valuing and promoting formative approaches to assessment in her school community (Ministry of Education, 2011; Wiliam, 2011). She described how the school had changed the way they communicated learning with families when a disconnect between learning and assessment was recognized:

We stopped writing reports two years ago because it was a summative report, but we don't really do summative here because the students are always moving, what's next, what's next? Why would we write something summative when we haven't stopped?

Leanne was committed to partnerships with families and making visible the children's success through the *New Zealand Curriculum*, " ... we're a school, so the NZC is embedded in everything we do. If our children aren't embedded in the Curriculum, then we wouldn't be doing our job". She welcomed narrative assessment as a process that valued and commented on relationships:

Our narrative assessments start with a picture of learning, the tools used to support progress, what's happening, how it's happening, the context, curriculum links, including the child, together setting the next learning steps, and then sharing it with the family so they can give us feedback. Often feedback from parents really helps us to fine tune our teaching. We all get to see all the smaller steps ending up in a big achievement. Parents will say 'my child is a learner in the *New Zealand Curriculum*' - 'look my child's a learner'.

She appreciated assessment that enabled teachers to show that learning wasn't linear and could be unpredictable; that rangatahi progress in their own way; that progress looks different for every rangatahi, reinforcing the importance of teachers knowing rangitahi and their whānau. And that is something the school wants to celebrate.

Conclusion: the working partnerships that enable success for students and teachers

To better understand their students, teachers need to also understand all the ways, all the places, the various contexts in which students demonstrate what they know and can do. An understanding of learning as being stretched across people, places and things; with an understanding of competence as being context dependent, of necessity means that people must work together to build shared meanings of competence and learning. Students and their families are expert-partners in the assessment practices that support teachers to plan for, recognize and value learning.

Disability studies combined with a sociocultural understanding of assessment, teaching and learning has effectively provided the framework we have needed to highlight and build upon relationships that foster a better understanding of disabled students' learning. This approach has supported us to collaborate with teachers to explore how every student's learning can be noticed, recognized and responded to in ways that support student learning and more broadly foster cultures of belonging as schools work toward inclusion. Anna, Leanne, Ria, and Ria's whānau's story is one example of how assessment-capable teachers, students and whānau can work together to drive quality teaching and learning, deliberately adopting a standpoint that every student is capable, able to learn through the *New Zealand Curriculum*, and as Guerin (2015) has emphasized, that space can be made for the strengths and knowledge evident in observed interactions to be the focus of the assessment process.

Acknowledgments

We extend our thanks to the New Zealand Council for Educational Research's Teaching and Learning Research Initiative (TLRI) which provided financial support for this research. <http://www.tlri.org.nz/tlri-research/research-progress/school-sector/using-narrative-assessment-support-secondary-school>.

We extend our gratitude and thanks to the rangatahi, their teachers and whānau who worked with us to explore narrative assessment and teaching pedagogy so rangatahi can flourish at school.

Inclusive education debates

A postsecondary education is one of Western society's more valued and privileged pursuits. Regardless of social differences—class, sex, gender, race, ability—it is presumed that attending a college or university improves one's position in life. Engagement in postsecondary education is widely recognized as a means of promoting increased sense of belonging, improved community engagement, expanded career options, and increased chances for lifelong learning for adults (Baum and Payea, 2004; Evans et al., 2017). Scholars argue that what today's adult learners want from their education is ample opportunity to engage in academic study that is meaningful and allows them to advance personal and career opportunities (Armstead et al., 2010).

Article 24 of the United Nations Convention on the Rights of Persons with Disabilities (CRPD) (2006) prohibits discrimination against children with disabilities and mandates the right to inclusive education. However, for students with intellectual disabilities opportunities to benefit from pursuing inclusive education let alone an authentic postsecondary education have not been fully realized. Although many countries pledge to support inclusion for people with disabilities, progress has been uneven. In fact, many countries have been slow to shift from a segregated special education model (Hehir et al., 2016). In Canada and elsewhere, the traditional model of special education (i.e., life skills training, congregated, deficit-based, segregated classrooms) co-located on postsecondary campuses is more commonplace. The adult special education option, designed for eligible (some not all) post-high school students with intellectual disability, continues to replicate special education practices with claims that students will gain community access, inclusion, and lifelong learning. However, student outcomes continue to reveal disability oppression, unemployment and social isolation (Ferri and Connor, 2008; Crawford, 2011; Prince, 2016).

A dismal future prevails for so many adults with intellectual disabilities (Van Asselt et al., 2015). Individuals are more likely to live in poverty, social isolation, loneliness, experiencing devalued roles and poor health. Resisting further segregation for young adults, fueled advocates to rethink what educational options might better lead to lives of belonging and contribution in their community. Families and allies, wanting more inclusive lives for their loved ones, considered access to a typical postsecondary education as one of the more likely pathways to a good life. Their vision was to establish a way for students with intellectual disabilities, including those with significant disability-related support needs, to enroll in postsecondary institutions (PSI's) with support. Initiatives began in Canada by family leaders in the inclusion movement of Alberta and British Columbia. The vision for implementing inclusive postsecondary education has also grown in United States, Europe, and Australia.

This chapter casts an eye on the inclusive post-secondary initiatives for young adults with intellectual disabilities that have gained momentum in Canada over the last 30 years. These initiatives, energized by parents (and allies) who imagined a better future for their adult family member, continue to ground this hope in the belief that engaging in intentional relational educational practices within postsecondary settings increases the likelihood of life-long inclusion. Reported accounts are promising. For young adults in Alberta, postsecondary education has resulted in over 70% of alumni reporting positive life outcomes such as inclusive employment, often in their related area of study (Hughson and Uditsky, 2019). Initiatives continue to thrive with modest growth in the number of students gaining access to inclusive initiatives. At the time of writing, there are nine inclusive post-secondary education initiatives in the province of British Columbia, twenty-one in Alberta, one in Saskatchewan and three in Nova Scotia. These initiatives support students to enroll at colleges, universities and technical institutes in both private and public PSIs.

The articulated implementation of theory and practices in postsecondary initiatives in Alberta and British Columbia, offers a platform for describing the scope of practice in inclusive postsecondary education that has emerged. Here we focus on some stated essential features, explore emerging issues and pose forward thinking notions about possible life outcomes for adults with intellectual disabilities who participate in fully inclusive postsecondary education. Since inception, these inclusive postsecondary

education initiatives have adopted a radical vision about the possibility of offering student experiences in authentic postsecondary educational inclusion. Committed to transparency, reflective documentation of effective practices and emerging improvements position these initiatives as “sites of innovation” aspiring to live out the inclusive vision. It is a novel approach in education to set aside the reliance on organizational and programmatic design with the aim to learn more about how the power of relationships may or may not be a more likely approach to increasing a sense of belonging and learning for students who have been historically excluded from typical educational environments. Resisting formalized or standardized programmatic structures typically offered to students with “differences” was understood to be fundamental to avoid replicating the paradoxes reported in educational reform research (Slee, 2014).

Parallel to emerging inclusive initiatives in postsecondary education, debates about inclusion in public schools began in the 1990s, based on rights and entitlement rhetoric more often than on the inclusion movement driven by families. Despite many government policies and legislation to reform and create inclusive education systems in UK and North America, the ideas and policies remain vague and elusive today. Although competing inclusive education discourses and practices associated with race, ethnicity, gender and disability construct different meanings by different vested interests and by different people, a strong association between regular special education is retained (Dunne, 2009). Defining a coherent inclusive post-secondary education framework might be seen as reflecting similarities with the discursive tensions associated with the meaning of inclusive public education. The history of higher education traditions, economic basis for high returns on investment and the ableist culture of elite postsecondary institutions are but some of the apparent contradictions that rival progressive policies as a way forward to more socially equitable and inclusive educational systems regardless of individual differences (Kromydas, 2017).

The critical interrogation of the central educational debates encouraged these inclusive postsecondary initiatives to resist institutional and structural definitions that, by their very definition, might confine inclusive postsecondary education to a set of prescribed organizing practices, set of policies, programmatic naming, or identified spaces within the post-secondary landscape. Their perspective was also informed by an examination of the construction of discourse on diversity, patterns of “othering” as well as by research that continues to draw attention to the pervasive patterns, infrastructures, technological features of social exclusion and stratification that perpetuate significant barriers to achieving equitable education for students with intellectual disabilities (Graham and Slee, 2007; Slee, 2011, 2014). Attending to the paradox of naming programs as inclusive education and the ongoing discourses about student differences shaped the conceptualization and action of implementers of inclusive postsecondary education initiatives to avoid embedding “special programmatic designs” that reproduce stigma and the educational marginalization of adult students who are “different.”

Responding to competing discourses in educational research, dominant social biases and hierarchical leadership that drive reforms in complex educational systems, the emergence of inclusive postsecondary education in Canada continues to be guided by persistent efforts to minimize programmatic/institutional practices that separate students. Choosing, instead, to emphasize the development of intentional relationships that build on the ability of postsecondary communities to think and act in ways that actively promote student identity and belonging for those who have been historically excluded. There is a steadfast conviction that sharing the philosophy and theory that students engaged in meaningful connections while attending college or university courses and participating in the campus social life, will change their predicted trajectory. It is argued that embedding students in the full range of typical opportunities available to nondisabled students means they are more likely to contribute to campus and lead more valued adult lives. Central to establishing and implementing inclusive post-secondary education means that “inclusive practices” are characterized as finding ways and means to seek out and leverage existing social and academic experiences more likely to benefit all students, including students with intellectual disabilities.

Resisting definitions through focus on practice

While there are no assessments, high stakes testing or categorical programmatic design features associated with the implementation of this approach to inclusive postsecondary education, key features reminiscent of high-fidelity initiatives have been articulated by the initiatives (O’Brien et al., 2009; Aylward and Bruce, 2014; Hughson and Uditsky, 2019). Examining language usage patterns and the implications of long held assumptions are but one example. The innovators of inclusive education realize that, as a term, “inclusion” denotes social progression, a nice enough word, connoting magnanimity and beneficence as well as signaling welcome and tolerance. However, it is also understood that the excluded never chose their status and the change in conferred status is arbitrary. While discourses around inclusion, equity and diversity are now rapidly emerging in postsecondary education rhetoric and policy documents, a newly included student may retain that sense of being an outsider. Indeed, current institutional mandates to embrace diversity alongside the explicit, covert or simply tacit understandings associated with exclusive postsecondary institutional culture galvanize increasing attention to the implications of identity politics related to new policies, practices and relationships especially when applied by those who have seen inclusion as a birthright. Allowing students with intellectual disabilities to be part of the post-secondary education campus by the grace of the host, means practicing vigilance and critical reflection on everyday practices to side-step being seduced by other vague or elusive vested interests in institutional inclusion. Measuring implementation by accounting for those harmonious actions that contribute to increasing the inclusive experiences for students is identified as key to guiding inclusive postsecondary education practices. In practice, insights gained by examining and interpreting emerging practices that reflect the “least difference making” approach and build on the most meaningful (and sometimes new to all parties) connections and

relationships are the benchmarks that sustain hope in postsecondary settings that welcome individuals with intellectual disabilities (O'Brien et al., 2009).

Key features taking the place of programmatic design

Innovative thinking is often marked by visionaries' attention to changing intentional social practices. Facilitators of the initiatives aim to shift conscious and unconscious institutional habits of mind and "normative" social segregation by negotiating opportunities for learning, career choices, identity and belonging for students historically denied access and accommodation in a university, college or technical school. In no order and all of equal importance, key features include; (i) students enroll based on their desire to continue their education, there are no minimum academic or behavior requirements that must be met to enroll, (ii) initiatives build their understanding of typical student pathways and are intentional about uncovering the least difference-making approaches to addressing anything that might limit student participation on these pathways; (iii) adaptations and support are developed so that they are harmonious with student life; (iv) initiatives build the capacity of the campus community to support and include students, it is not one person's responsibility to "do" inclusion instead it is a shared commitment of the PSI and the inclusive postsecondary education initiative to work toward a more inclusive and equitable experiences that strengthen future relationships.

To repeat, inclusive postsecondary initiatives ensure students, enrolled at their local technical school, college or university, do not attend any specialized, congregated classes or program supports targeted to their disability label. Instead, initiatives intentionally support students to select options from the existing postsecondary programs of study. This is in stark contrast to historical and current assumptions of special education approaches that believe students need specialized preparation and segregated learning opportunities to compensate for their cognitive impairments before they can participate in adult education. Inclusive postsecondary education contests this approach by supporting students to explore and select an available program of study based on their own dreams and hopes for learning in their PSI. Any additional campus services or programs used by typical students are sought (if needed) in the same way by students with intellectual disabilities.

Each student selects courses and follows a coherent pathway along with their classmates over the respective years in that discipline/program. The inclusive postsecondary education facilitator and faculty members collaborate to modify course work for each student so that they are fully engaged in all the typical class learning opportunities (assigned reading, labs, tutorials, exams, assignments, field schools). Students do not receive a credit for their course work which allows for the modifications to be tailored to the learning style and the learning goals of the individual student. Upon completion of their program of study they receive a certificate of completion, portfolios of course work in their program of study with references and participate in convocation with classmates from their program of study.

Over the last 30 years, students with intellectual disabilities in Canada have pursued programs of study across a wide array of academic, artistic, and technical fields. Inclusion in a program of study and in individual courses is established with the permission of the faculty program of study and individual professor. Overwhelmingly, the evident responses of program administrators and faculty reflect an openness and eagerness to include a student who is interested in joining their class. This relational approach to course enrollment invites professors, instructors and Teaching Assistants to meet with inclusion facilitators who work closely with the student requesting the course. Building on this relationship means instructors can learn about the student's interest in the course, their goals and the role of the inclusion facilitator in supporting the course modifications and the student experience beyond the classroom. Inclusion facilitators are in regular communication with professors and instructors to discuss strategies and identify promising practices that forge a student's sense of belonging in each class.

This relational approach to individual student course enrollment is a departure from the typical ways academically eligible students with disabilities must request academic accommodations when choosing their postsecondary program of study. While governing processes may be unique to each PSI, access and accommodation is usually characterized by a legal duty implemented by an infrastructure that requires a medical diagnosis of disability, an emphasis on confidentiality (to the point of anonymity) and policies that place the burden of seeking accommodations on the student (<https://sswd.jibc.ca/duty-to-accomodate/>). Instead of such a puzzling approach to predicting and controlling disabled student's engagement based on a medical diagnosis, inclusion facilitators participate with willing professors in an iterative practice. Each term the student engages with the course, the facilitator and the instructor to develop least intrusive accommodations and/or instructional strategies to engage with course content. The inclusion facilitator aims to establish accommodations and strategies that are typical of the classroom setting and are the least intrusive to customs of the class. Professors, with no special education training, have found that they are able to make adaptations to their learning environment that increase student engagement and in fact, report that such instructional changes have a positive impact on all their students. Furthermore, the faculty have indicated that active participation in broadening the diversity of their classrooms has challenged their own limited assumptions about the learning goals of students with intellectual disabilities (Bingham and Duncan Bonokoski, 2018).

Facilitation as a strategy for advancing inclusion

The facilitated supports for students with intellectual disabilities are multifaceted, often perceived as counter cultural and represent operational features that are unique to the inclusive nature of these initiatives. Inclusive postsecondary education facilitators are

most often employed by a non-profit organization external to the PSI. Their work on campus is made possible through a memorandum of understanding or partnership agreement between the PSI and the non-profit organization. In a few initiatives in Canada, inclusion facilitators are employees of the PSI. Facilitators have no formal role or authority conferred by the postsecondary infrastructure. Rather, the focus of their work is to advance inclusion through collaborations that invite an interest in potential shared activities that might spark an interest in mutual connections. Uncovering student capacities to adopt new roles, facilitators look for coherent student opportunities that benefit a student with an intellectual disability in the same way typically enrolled students benefit from their academic and social roles and experiences. Facilitators find ways for people to meet and learn about each other. For many nondisabled students, these encounters are unique as education in regular education systems often limit natural encounters with students with intellectual disabilities. These strategies are rooted in the hope that making space for freely given friendships happens when typical students identify personally with the student, their instructors, other classmates, members of campus clubs and other student services. There are repeated accounts of members of the PSI community welcoming students in courses, student clubs and informal social activities of campus life.

Unsurprisingly, facilitators identify encounters of conscious and unconscious social bias that can interfere with a normative student experience. For example, because course work is not for credit, instructors may have lower expectations for students to submit their assignments or to complete exams. When this occurs, facilitators work with instructors to emphasize the importance of keeping their expectations high when it comes to typical student participation in the course. In courses with group work, facilitators connect with group classmates as a resource to support the assigned group to figure out how to meaningfully include the student when the group dynamic may be insensitive or assume the student's participation is less important. This might involve highlighting the student's strengths and working with the group to identify a role in the project for the student to add value to the group assignment. Facilitators indicate that this practice opens opportunities for positive interactions that challenge classmates' assumptions about the student's desires and have been known to shift and affirm that the student with an intellectual disability share the same goals as the nondisabled peer.

Facilitators describe examples of occasional encounters with blatant social bias when students with an intellectual disability chose to enroll in a program of study related to the helping professions or teacher education. Facilitators are keenly aware of the thin veneer of inclusive discourse that nonetheless fosters widespread negative assumptions consciously or unconsciously in professional disciplines rooted in medical constructs of disability. They recognize the importance of confronting inequality and devaluing assumptions that impact the students' identity and participation as a member of the class. Specifically, facilitators found that student identity can be at risk when an instructor initially sees the value of a student joining their social work or education class because it would provide an opportunity for their typically enrolled students to gain experience with a person who they might serve as a client in their future career. In order to protect the students' identity and role as a valued learner in the class, facilitators meet with the instructor before the student joins the class, to reinforce the fact that participation in class is expected just as any other student—not “placed” as a practicum opportunity for other students. Facilitators are careful to explain that the greater value would be derived from students learning how to work alongside someone with a disability, proposing that one day, they may become work colleagues in their chosen field. Such confrontational conversations have been reported as uncomfortable, however, instructors, peers and PSI staff largely report the interactions are welcome because the institutions want to learn more about how faculty can be inclusive leaders in creating just communities of practice on and off campus.

Emanating inclusion through a commitment to reflective practice

Those experienced in implementing inclusive postsecondary initiatives recount the ubiquity of exclusion and know no blueprint for identifying and dismantling the negative devaluing beliefs that perpetuate social biases tied to the label of intellectual disability (Hughson and Uditsky, 2019). In fact, documented gaps in social and economic life outcomes for people with intellectual disabilities remain current indicators that reinforce long held stereotypes and prejudices endemic to postsecondary community. Facilitating inclusion within the postsecondary context is further complicated by the many ways that a busy student life unfolds. Complexities of social and academic life for a student may tempt a facilitator to seek simpler solutions. One such risk is a drift toward implementing a special education or charitable approach to resolve perceived vulnerabilities such as loneliness or risky individual choice, rationalizing that such actions are needed in the name of safety or compassion. To safeguard engagement in valued practices, inclusive postsecondary initiatives have built in operational activities that regularize commitments to set times for reflective practice. Sharing the challenges, risks, and successes in formal and informal ways are seen as a systematic approach to examining alternatives that might disrupt the pervasive reaction to protect by segregating.

Reflective practice is known to be essential to countercultural work in emerging pockets of social innovation. Inclusive postsecondary education initiatives share the view that such practices are central to their mission. To that end, these initiatives put considerable effort into collectively interrogating ways to understand commonly held devaluing beliefs, circulating their experiences and critiquing the narratives that are retold. Critical examinations of student experiences are reviewed each term and mutual plans are made to improve efforts that pull students into valued roles and relationships not bound by low expectations and loneliness. Documenting reflective conversations and interpretations capture promising practices that are shared with “critical friends” interested in innovation and change. Annual inclusive postsecondary symposiums have been hosted over the last few years (see: <https://www.center-ipse.org/2021-symposium-resources.html>). Initiatives know what is at stake and want to push the inclusive

agenda in education, particularly when current policies, cultures, and practices continue to place students with disabilities at greater risk of educational and social exclusion (Slee, 2014).

As well as regular reflective practice, an evaluation tool has been developed by the early implementers of inclusive postsecondary education in Alberta. This tool articulates the commitments of inclusive post-secondary education and lays out benchmarks that are used to understand the quality of inclusion experienced on campus. The evaluation process is not interested in satisfaction or performance appraisal of students, faculty, their families or the post-secondary administration. Rather the benchmarks help focus the analysis of these accounts by considering how students are embedded or not in an authentic student experience. The evaluation tool is used by designated teams of inclusive postsecondary peers both external to and connected with the initiative being evaluated. Measuring the quality and fidelity of practices that describe the students' experiences at one point in time include gathering interviews with faculty, students, families, administrators, and alumni engaged in inclusive postsecondary education initiatives (O'Brien et al., 2009). Regular evaluation by "critical friends" is a salient commitment for inclusive postsecondary education initiatives as it is usually easier to fall into perpetuating habits that accept the status quo of access rather than push the practice forward. This commitment to evaluation, by initiatives who are deeply curious about ways to facilitate intentional relational education practices, ensures that implementation is held in a state of innovation from which new learnings and practices can emerge.

What is sustainable and what emerges

It is important to contemplate what will sustain and safeguard inclusive postsecondary education while inclusive education debates and doubts continue. Many questions arise. Will the preoccupation with the value of credentialing create barriers? Is it possible to critique design elements that are typical of elite educational systems while leveraging the existing pathways and programs that are normatively offered? As described earlier, students do not meet academic prerequisites to enroll. What is known to date, is that participating PSI's continue to adjust routine rules, welcome and accept students with intellectual disabilities that were systematically denied access to an education that met the pre-requisites to PSI admission.

Inclusive postsecondary education troubles other long held traditions in education. Students with intellectual disabilities welcomed in postsecondary level courses in a wide range of subject matter, including upper-level courses without the academic prerequisites, shift the pedagogical assumption that all student learning naturally unfolds in sanctioned curriculum of sequenced developmental pattern delivered in modules from simple to more advanced concepts. Educational philosophers and critics ponder the current repackaging of educational activities as "learning" activities whereby education is described as the provision of learning opportunities or learning experiences (Bingham, 2015). An emerging body of educational theory argues that there is not one known logic or a particular natural "rate" of learning. The experiences and accomplishments of students with intellectual disabilities included in postsecondary education bring life to new theorizing.

While the expectations for learning in inclusive post-secondary initiatives may disrupt typical educational designs, the "work" also actively engages and leverages student roles and identity in the defined programs of study offered. Enrolling in an identified postsecondary program of study from the outset, builds the student's sense of belonging and identity in the mores, customs and status associated with that career path (such as an ecology student, a business student, or a trades student). From year to year the inclusive postsecondary initiatives facilitate more and more students who have connected with instructors, classmates and club members associated with their specific interests in chosen programs of study and do go on to gain inclusive employment. Continuous participation in a wide range of postsecondary programs of study over the years may lead more faculty, administrators and students to expect there will always be a place for students with intellectual disabilities in the classroom. More students with intellectual disabilities can imagine pursuing further studies in higher education alongside peers with the same interests and goals. Furthermore, the expectations for equal opportunities to engage in learning have the power to move beyond campus boundaries and into the professional and personal lives of all postsecondary graduates who have the benefit of experiencing authentic inclusion through their postsecondary education. It is not uncommon for facilitators to report that the student's success in finding paid employment in their field after graduation is the result of an employer having experienced inclusion through their post-secondary studies.

Inclusive postsecondary education disrupts some long-held conventions. For example, it has been the role of universities and colleges preparing students for roles in social science disciplines such as education, psychology, social work and medicine to mirror social and cultural inequalities and social hierarchies. Some social science disciplines theorize and define intellectual disability in terms of categorical diagnoses based on deficits, lack intellect and individuals are seen as being in a state of disconnectedness from those without disabilities (Klewer et al., 2015; Goodley, 2007; Slee, 2001). Such social constructions invite educators to continue to conclude that people with intellectual disabilities are unable to meaningfully engage with same age peers in regular education curriculum. In fact, when such constructs are believed to be "true" or "natural" further progress in inclusive education is unlikely to be realized. However, in postsecondary settings where inclusive initiatives have grown and established relationships, many key faculty members and classmates have already opened doors to some interesting possibilities for educational and social change. Practices that actively construct the "work" of inclusion together with professors, instructors, teaching assistants, postsecondary administrators, and students may be a way to unpack devaluing assumptions and create spaces to know students with intellectual disabilities as learners and contributors. Presumed competence embraces the theory that belonging is essential to learning (O'Brien and Mount, 2015). Inclusive initiatives provide opportunities for many more people to share some common experience throughout their postsecondary education and to engage with students with intellectual disabilities from a place of connectedness. To create the

conditions for adults with intellectual disabilities to become fully realized students becomes a work in progress, suggesting that we are only limited by a lack of imagination. These relational experiences, intentionally facilitated in unremarkable ways, may quietly chip away at the cultural politics of disablement (Slee, 2001) and open new possibilities for students with intellectual disabilities to break through the biases that stand in the way of their education, employment and social connections. Hundreds of postsecondary courses and programs of study have welcomed students over the last 30 years. Accordingly, many shared experiences across time and settings, have been taught by hundreds of different faculty members (Hughson and Uditsky, 2019) and freely given relationships have directly emerged among peers and students with intellectual disabilities because of their mutual participation in class and in extra-curricular activities across campuses. These initiatives may not persuade those engaged in vague and disputable interpretations of inclusion on the one hand, while on the other, there are those who know inclusive education can be realized.

Glossary

Accommodations or adjustments Steps taken by an education provider that enable a student with a disability to enroll, access, or participate in higher education on the same basis as their peers

Barriers Obstacles that prevent a student with disability from accessing tertiary education or that can prevent their ability to participate and demonstrate their ability

Higher education Courses that are completed by students as post-secondary education, that may lead to an advanced qualification such as a vocational certificate, certificate, diploma, advanced diploma, graduate certificate, post-graduate certificate, bachelor degree, masters degree, or doctoral degree

Inclusive learning An experience where all students learn alongside one another, in an environment where diversity is respected, celebrated, and accommodated, where all students have equitable opportunities for participation, and the barriers that prevent learning have been recognized and removed wherever possible

Inherent requirements The core knowledge, skills or abilities considered essential in order to perform a task safely and effectively within the workplace, e.g., in order to drive a bus/coach, an inherent requirement is that the driver has a valid drivers' license that permits the driver to operate that class of bus/coach

Reasonable As much as is necessary or fair, that enables the person with a disability to enroll, access, and participate in education on the same basis as their peers

Universal design Designed through careful planning to allow education, to the greatest extent possible, to be accessed and understood by, and inclusive of, all students

Introduction

On December 13, 2006, the Convention on the Rights of Persons with Disabilities (CRPD) and its Optional Protocol ([United Nations, 2006](#)) was adopted, then opened for countries to sign from March 30, 2007, and finally came into force on May 3, 2008. There are 193 member states of the United Nations, with the UN CRPD the most widely ratified human rights treaty, currently ratified by 182 member states ([United Nations, 2006](#); [Kanter, 2020](#)). In ratifying a UN convention, member states agree to ensure that domestic legislation is introduced or amended to comply with the obligations specified within.

Article 24 (section 1) of the United Nations *Convention on the Rights of Persons with Disabilities* ([United Nations, 2006](#)) recognizes the right to an inclusive education without discrimination for people with disability. It articulates the purpose of this is to allow students with disability to develop their sense of self-worth and dignity, their talents, and their abilities, to the fullest extent possible so that they can participate within society. Article 24 (section 5) makes explicit that this right extends to “general tertiary education,

vocational education, adult education and lifelong learning” and for this right to be realized, reasonable accommodations must be provided to students (United Nations, 2006).

This right was further reinforced by *General Comment No. 4* (United Nations [Committee on the Rights of Persons with Disabilities], 2016) which obligates member states to ensure that learners with disability should be provided an accessible education, including equal access to tertiary education without discrimination and on the same basis as their peers (section 23). Member states are further encouraged to adopt affirmative action measures to ensure learners with disability can access and participate on an equal basis. These measures must address attitudinal, communicative, financial, legal, linguistic, physical, or other barriers that inhibit access and participation (section 37). Section 69 calls upon member states to ensure that there is a process for educating tertiary staff so that they have the necessary skills to provide inclusive learning environments. One recommendation is that all staff are “provided with dedicated units/modules to prepare them to work in inclusive settings, as well as practical experiential learning, where they can build the skills and confidence to problem-solve through diverse inclusion challenges” (United Nations [Committee on the Rights of Persons with Disabilities], 2016).

As Slee (2018) reminds us, for decades universities have played a pivotal role in training and grooming social elites so that they can take predetermined places in professions and leadership roles within industry, while students with disability have “been hidden behind the edifice of special education” (p. 39). Research that investigates the experience of students with disability in higher education is beginning to grow (Linder et al., 2015). From this research, we learn that the traditional methods for teaching and assessing used within universities continue to disadvantage students with disability, and that curriculum reform in higher education is critical to the inclusion of students with disability (Taylor and Shallish, 2019; Podzo and Chipika, 2019). Further, while the UN have called for member states to ensure that students with disability can access a tertiary education without discrimination, and on the same basis as others, the experience of students with disability in post-secondary environments suggest much work is still needed to improve access and participation so that students can thrive in post-school educational settings.

The purposes of this article are to (a) familiarize readers with the extent of enrollment of, and the legal obligations of higher education institutions toward, students with disability, (b) identify the provisions currently offered to this set of learners, (c) explore the barriers and facilitators to access, participation, and engagement within higher education for students with disability, and propose future directions for enhancing the educational experience so that students with disability can engage in life-long learning and have their inclusive education rights upheld.

Students with disability in higher education

The 21st century has seen an influx of people with disability into higher education across the globe (Caleb and Barden, 2019; Barnes, 2007; Konur, 2006; Biggeri et al., 2020; Werth et al., 2014; Ganguly et al., 2015; Zeng et al., 2018; Moriña et al., 2014; Grimes et al., 2019). The drivers for this increased participation, in addition to international human rights agendas, include legislative enactments, higher education policy agendas, improved institutional ethos, and provisions made available to support participation and engagement (Brett, 2016; Riddell et al., 2005; Brandt, 2011; Sarkar, 2016; Madaus et al., 2012; Werth et al., 2014).

Fig. 1 shows the growth of Australian students with disability accessing tertiary education between 2012 and 2019.

This represents a growth in access of 87.13% over the past decade. This is considerable when compared to the growth for the total number of students accessing higher education was 17.49% measured over the same timeframe (Australian Government, 2020b). But, as Gale (2010) cautioned, inclusion of people with disability is not purely about numbers, and for inclusion to be the lived experience of students with disability in higher education, it is critical that we reconfigure higher education to meet our ratified obligations.

Fig. 1 Access by Australian students with disability to higher education.

Legislative obligations

Countries around the world have passed legislation enshrining the rights of students with disability in higher education (Moriña et al., 2014). In the United States, the legal mandate to provide adjustments for students with disability in higher education was initially documented in the *Rehabilitation Act of 1973*, and reinforced in the *Americans with Disabilities Act of 1990*, the *Americans with Disabilities Act Amendment Act of 2008*, and the *Higher Education Opportunity Act of 2008* (Behling and Linder, 2017; Kimball et al., 2016). In the United Kingdom, the passage of *The Disability Discrimination Act* (Home Office, 1995) was amended in 2001, through *The Special Educational Needs and Disability Act* (Department of Education and Skills, 2001) to include education and an obligation to provide reasonable adjustments. Further, in late 2006, the *Disability Equity Duty* (Disability Rights Commission, 2006) obligated higher education institutions to treat students with disability fairly and equitably on the same basis as their peers. In Australia, the *Disability Discrimination Act 1992* (Australian Government [Federal Register of Legislation], 2017), the *Disability Standards for Education 2005* (Australian Government, 2020a), and the *Disability (Access to Premises—Buildings) Standards 2010* (Australian Government [Federal Register of Legislation], 2020) provide the federal legislative platform for ensuring the rights of students with disability are upheld in educational settings, including those that serve post-secondary students.

Legislative frameworks are a way of countries demonstrating their compliance with their obligations as a signatory to the UN, but they are also important because they offer clarity to providers in meeting their obligations to people with disability, and are meant to afford people with disability protection against discrimination (Poed, 2016). To enable students with disability to access education, and participate on the same basis as their peers, legislation typically specifies what actions an education provider must take to ensure that students with disability are not treated less favorably and to avoid actions that would be viewed as discriminatory.

Reasonable adjustments

One action usually imposed by legislation on education providers is an obligation to provide reasonable accommodations or reasonable adjustments. Often used interchangeably, the term “reasonable accommodations” was adopted in the *Americans with Disabilities Act of 1990* (United States [Department of Justice—Civil Rights Division], n.d.), while the term “reasonable adjustments” was adopted in the *UK Equality Act 2010* (Government Equalities Office and Equality and Human Rights Commission, 2015) as well as the Australian *Disability Standards for Education 2005* (Australian Government, 2020a). Both refer to either actions or measures taken by an education provider to ensure that students with disability can enroll, access, and participate in education and training on the same basis as their peers (Ashman, 2019).

Reasonable accommodations/adjustments typically afforded in higher education

At the end of the previous century, the *United Nations Educational Scientific and Cultural Organization* (1999) surveyed the provisions made for students with disability in higher education. Responses were provided by 35 universities from different UNESCO regions, with adjustments being summarized under an array of categories.

First, some generic adjustments included general and specialized student counseling, training of staff (both academic and administrative), and resourcing support services for students with disability. Second, a small number of universities acknowledged adjustments made to the entrance process for students with disability, including supporting students to select an appropriate course, providing preferential treatment through modified (lower) entrance criteria, and exempting students from having completed prerequisite studies/subjects. Third, environmental adjustments were made including ensuring physical, visual, and auditory accessibility for students on campus to lecture theaters, laboratories, libraries, and the campus more broadly, as well as to living quarters, toilets, parking facilities, special transportation, telephones, and cafés/restaurants. Fourth, supports were made to allow students with disability to achieve academically, including flexibility around due dates, content delivery, adjustments to examinations, pedagogical support provided by tutors, adapted texts, and assistive technology (including training in its use). Fifth, the survey found universities were making adjustments to allow students with disability to thrive socially, including encouraging students with disability to join regular student clubs, but also creating special associations for students with disability. Finally, some universities reported providing adjustments to assist students with disability post-graduation, including career planning (United Nations Educational Scientific and Cultural Organization, 1999).

Disability support services

In keeping pace with the increased presence of students with disabilities accessing post-secondary education, there has also been a rise of disability support services provided in tertiary institutions. Known by various names including equity support units, disability services units, and disability resource units, these services are meant to “level the playing field” through the provision of adjustments that allow students with disability to access and participate in higher education on the same basis as their peers (Clark et al., 2018). The staff who work in these services translate the university’s legislative obligations, as well as their policies and procedures, into a set of services that enable students with disability to access and participate, and hopefully excel, in their

studies (Hartley, 2015). Those who work in these services have been challenged to find ways to ensure that higher education curriculum across all disciplines is accessible for students with disability (Behling and Linder, 2017).

To access support through disability services units, students are often required to disclose and provide evidence of their disability diagnosis. Research indicates that disclosing a disability at the point of enrollment or throughout their degree can be a vexed decision for many students (Ganguly et al., 2015; Clark et al., 2018). For students with disability, particularly those with “hidden disability”, reasons for not disclosing are often cited as:

- concern that disclosure may result in not being offered a place at university,
- perceived or real stigma, where deficit and medical models of disability define who can access additional supports,
- not wanting to seek medical confirmation or an assessment to access services,
- unawareness that a medical condition, learning disability, or mental health diagnosis makes them eligible for access to disability supports,
- costs associated with getting an assessment or diagnosis confirming their disability,
- concerns about the impact disclosure might have on staff perceptions, opportunities for post-graduate study or employment,
- fear of discriminatory or differential treatment and negative peer and staff attitudes,
- lowered self-esteem tied to their diagnosis, and
- past negative experiences associated with disclosure (Clark et al., 2018; Couzens et al., 2015; Werth et al., 2014; Kent et al., 2018; Ganguly et al., 2015; Hernandez, 2011; Jacklin, 2011; Kimball et al., 2016; Markoulakis and Kirsh, 2013; Dunn and Burcaw, 2013; Vickerman and Blundell, 2010; Grimes et al., 2019; Fossey et al., 2015).

Clark et al. (2018) found four circumstances in which students are less likely to disclose their disability: (1) if they are able to hide their disability from others, (2) if they perceive the higher education environment to be hostile toward students with disability, (3) if the request for receiving adjustments is confronting, and (4) if there is no perceived benefit in disclosing, or if the benefits of disclosure are unclear. This reluctance to disclose can result in students with disability needing to spend more time completing tasks than their peers, having less time for social opportunities or for employment, and increased anxiety (Kimball et al., 2016). Further, a failure to disclose can result in the student with disability waiving their right to adjustments (Grimes et al., 2019).

The onus to disclose also applies to students for whom English is an additional language or dialect or students who are First Nations/Indigenous, and similar barriers to disclosure have been identified for these cohorts of students, raising the added concern as to whether intersectionality; that is, overlapping identity markers; further decreases self-disclosure rates.

Fossey et al. (2015) found that disability service staff have a different set of criteria on which they judge the success of their work when compared to the judgments made by students with disability. Staff tend to believe they have successfully supported students with disability based on retention rates, or on students deferring in order to better prepare for tertiary studies; students, however, judge the impact the adjustments had on their outcomes, their motivation, and their enjoyment of their studies.

Barriers to higher education for students with disability

Yusuf et al. (2009) issue the challenge that with widening participation of students with disability into higher education, we have an obligation to ensure that we are not simply bringing “a flood of students into increasingly dysfunctional institutions” (p. 110). While, as an example, Australia has experienced a growth of almost 90% in the number of students accessing higher education over the past decade, each year over the same timeframe retention rates have steadily remained around the 80% mark (Australian Government, 2020b). In comparison, retention rates for all students hover between 82 and 83%, indicating a slightly higher rate of attrition for students with disability (Australian Government, 2020b). This may be because the adjustments provided to students with disability in higher education are enough simply to survive, but not sufficient to thrive (Reutlinger, 2015).

As noted by Strnadová et al. (2015), the barriers experienced by students with disability in higher education are prevailingly institutional; adapting the culture and climate of higher education institutions is still the key to removing these barriers. Most critically, students offer external environmental issues as the most common barriers, rather than individual factors impacting their academic success (Ganguly et al., 2015). Students advise that their ability to navigate the system to identify the supports available to them can be the first hurdle (Edwards et al., under review). Further, students identify that misunderstandings by teaching staff, negative attitudes of peers and both administrative and teaching staff, inaccessible curricula and pedagogy, low expectations, attendance demands, frequent turnover of disability support personnel, lag times in accessing accommodations and supports, poor universal access to the campus environment, as well as health, counseling, and financial difficulties as key barriers (Ganguly et al., 2015; Fleming et al., 2016; Moriña et al., 2014; Grimes et al., 2019; Verdinelli and Kutner, 2016; Strnadová et al., 2015). Students report that even when provided with appropriate documentation, some academic staff still refuse to provide adjustments (Ganguly et al., 2015). Hartley (2015) also reported that students expressed uncertainty as to whether investing in higher education was worth it given the lack of job opportunities and barriers to employment experienced by people with disability.

Barriers have also been identified by staff who work with students with disability. A common barrier is the time available for collaboration between disability support personnel and faculty members to co-design learning materials (Behling and Linder, 2017). Some academic staff believe they have no responsibility for providing accessible curricula, instead viewing this as the sole responsibility of disability services staff (Linder et al., 2015). This problem is exacerbated by the under-resourcing of disability support services as well as funding for making learning accessible through captioning, purchasing, and maintaining technologies,

and other accessibility resources (Behling and Linder, 2017; Linder et al., 2015). During the global COVID-19 pandemic, these barriers were exacerbated as university services shut down and students with disability experienced delays in accessing services and adjustments (Meleo-Erwin et al., 2021).

A range of barriers have been noted in relation to academic staff, including reports of some staff having:

- A lack of knowledge or awareness about the requirements of students with disability,
- A lack of skill/training in making the necessary adjustments,
- A belief that students with disability are not able to achieve at the same levels as their peers,
- A belief that more time is needed to support students with disability, which impacts workloads and positions students with disability as a burden,
- A belief that students with disability are already well supported by disability services, and it is beyond the scope of an academic's workload to offer further assistance, and
- A lack of will in accommodating the requirements of students with disability particularly when they perceive this offers the students an unfair advantage over their peers or diminishes the academic integrity of what is being assessed (Behling and Linder, 2017; Linder et al., 2015; Couzens et al., 2015; Baker et al., 2012; Yuknis, 2014; Fleming et al., 2016; Vickerman and Blundell, 2010; Moriña et al., 2014).

Pedagogical tensions sometimes surface as a barrier, where faculty members argue the traditional ways in which content is taught or assessed are pedagogically sound, and any changes to these approaches are seen as threatening to entrenched and deeply held views (Behling and Linder, 2017). Some students see these pedagogies as methodologies for teaching rather than methodologies for learning; that is, the focus is merely on the transmission of content (Moriña et al., 2014).

These barriers can be further exacerbated by professional registration bodies who specify inherent requirements students must be able to achieve in order to be job-ready at graduation, without consideration about whether these inherent requirements can be achieved with the support of reasonable adjustments in the workplace (Couzens et al., 2015). The issue of inherent requirements is further exacerbated by the lack of involvement of people with disability in determining inherent requirement statements, and considering how these might be met through the provision of reasonable adjustments (Johnston et al., 2016).

Facilitators to higher education for students with disability

Students have identified a range of facilitators to their success in higher education. Knowing their own strengths and needs, and being able to discuss these with disability support staff and academics is viewed as critical to their success (Ganguly et al., 2015). Also, knowing what supports are available, and being able to access direct assistance is also considered important (Ganguly et al., 2015; Zeng et al., 2018). Comprehensive support programs, including peer support networks, have also been identified as an important facilitator (Ganguly et al., 2015; Zeng et al., 2018).

Curriculum and pedagogical reform have been identified as critical facilitators. There is an onus on academics to pay attention to the course content, teaching and assessment methods to ensure that, where possible, the need for adjustments can be minimized (Bunbury, 2020). Simple content adjustments, such as providing alt text and image descriptions for students with vision impairment (Lewis, 2018) are still seen as the role of the Disability Services team rather than the responsibility of an academic. Additionally, pedagogical adjustments have been shown to assist students with disability access and participate in higher education. The recording of lectures, supplemented with captioning, assistive technology, and accessible notes, is critical to increasing access for students with disability, while also helpful for a range of their peers (Zeng et al., 2018; O'callaghan et al., 2017; Grimes et al., 2019). Flexibility in the ways in which students access content is an enabler, rather than rigid policies that mandate on-campus attendance in lecture theaters. During the global pandemic, universities have needed to be more flexible with all students regarding attendance and participation requirements and submission of assessment tasks, and consideration of ways to enhance digital interactions and social connectedness (Benito et al., 2021). There are opportunities here to learn from these lessons and implement universal curriculum, pedagogical and assessment reforms that benefit all learners, particularly those with disability.

The current lack of training to equip lecturers to teach students with disability is recognized internationally (see, for example, Burgstahler, 2015; Cunninghame et al., 2016; Fleming et al., 2016). Key findings from the Final Report on the 2020 Review of the Disability Standards for Education 2005 are consistent with these claims, reporting Australian educators, including those in higher education, are aware of their legal obligations to provide adjustments, but unclear as to how they should be implemented within their teaching practice (Australian Government [Department of Education Skills and Employment], 2021).

Universal Design for Learning (UDL) in higher education has been found to show promise in enabling students with disability greater access (Kimball et al., 2016; Roberts et al., 2011; Fleming et al., 2016; Edwards, 2019). UDL is a framework used by educators, underpinned by a set of principles to improve the ways in which content is transmitted, the ways in which students can demonstrate their knowledge, and the ways in which students engage during the teaching-learning transaction (Rogers-Shaw et al., 2018). Universally designed curriculum, teaching and assessment provide student experiences which address three broad objectives:

- (1) students should be able to interact with and respond to materials in multiple ways,
- (2) students should be able to find meaning and thus motivate themselves in different ways, and
- (3) ... course material must be accessible to all (Australian Disabilities Clearinghouse, n.d., para. 3)

These inclusive design ideals are student-centered and have the potential to benefit all students. The investigation by Dean et al. (2017) into the use of UDL within large marketing subjects found it to be highly effective, empowering students to take responsibility for their own learning as barriers commonly found in large class settings are decreased (p. 13). To employ such inclusive practice, however, requires a rethink of how learning is designed, delivered, and assessed.

Finally, the co-design of university spaces, drawing from the lived experiences of students with disability is a further enabler to the access and participation of learners with disability in higher education. Where attention has been paid to physical access with ramps, elevators and tactile signage, accessible laboratories and lecture theaters, assistive listening technology and tactile signage, attention now turns to sensory design as well as accessible materials and virtual spaces.

Conclusion

In 1998, Sheila Riddell encouraged those in higher education institutions supporting students with disability to continue to “chip away at the mountain” of barriers that block the full and active participation of students with disability. While the numbers of students with disability enrolled in higher education might suggest success in scaling the mountain, an abundance of research continues to point to the ongoing challenges along the journey (Fleming et al., 2016; Vickerman and Blundell, 2010; Griful-Freixenet et al., 2017; Moriña et al., 2014; Grimes et al., 2019; Verdinelli and Kutner, 2016; Strnadová et al., 2015).

In spite of the myriad of legislative and policy frameworks that enshrine the rights of people with disability to access education (including higher education), significant barriers still inhibit equal access (Poed, 2020). Werth et al. (2014) suggest that the inclusion of students with disability in higher education must extend beyond conversations that focus on disability services and supports, rights and reasonable adjustments, and begin to embrace “the promotion of values, frameworks, pedagogies, and practices that aim to bring about greater levels of normalization, and inclusion of students with a disability” (p. 107). It is time for higher education institutions to embrace inclusivity; students with disability enrich the learning environment making it accessible for, and inclusive of, all students (Moriña et al., 2020).

Introduction

Australian governments are committed to improving the participation, wellbeing and academic outcomes of the sizable portion of the Australian school student population who have a disability. The past decade has seen several significant advancements in education policy relating to students with disability, including the adoption of a nation-wide practice model, a shift to a needs-based funding model and the creation of the Queensland inclusive education statement.

However, the available evidence suggests that, over this period, there has been limited meaningful advancement in the outcomes and experiences of students with disability. Drawing on evidence tabled during recent reviews and inquiries into the experience of students with disability, this article highlights common issues associated with the schooling experience of these students in Australia.

Noting these issues, and their persistent nature, the article examines the barriers which impede the adoption of more inclusive education structures, methods and practice. The article then provides concluding remarks and discusses the role of future research and inquiry in helping Australian education jurisdictions dismantle these barriers.

The Australian context

Within Australia's federated model of governance, there are multiple layers of responsibility for schooling. Australian state and territory governments are responsible for delivering school education, including registering, regulating and operating government schools and they provide the majority of funding for the operations of government schools. The Australian Federal Government provides additional funding to government schools and is the primary government funder of non-government schools.

The Australian Government influences education policy through the provision of conditional funding. This typically takes the form of large-scale initiatives which tie the provision of federal funding to participation in nation-wide initiatives or reforms. Australia has a national curriculum, national assessment program and national school data collection, which are conducted by the independent statutory agency the Australian Curriculum, Assessment and Reporting Authority (ACARA). Major reforms to education are also progressed by the Education Council, which is a body comprised of education ministers from the Australian, state and territory governments. The Education Council helps to shape policy and decision-making across all school systems within Australia.

Over recent decades, particularly since the publication of the Salamanca Statement of Special Needs Education (the Salamanca Statement, UNESCO, 1994) and the United Nations Convention of the Rights of Persons with Disability (CRPD, 2007), Australian governments have demonstrated their commitment to improving the participation, wellbeing and academic outcomes of students with disability.

Efforts to improve the educational experiences of students with disability have largely centered on the introduction of rights-based legislation, and aspirational and binding policies. There have also been substantial developments in policy and funding

Table 1 International and domestic legislative instruments informing education for students with disability.

<i>Instrument</i>	<i>Relevance to education of students with disability</i>
Disability Discrimination Act (1992)	The Commonwealth Disability Discrimination Act of 1992 (DDA) legislated the right of all students to enrol in their local school (Attorney-General Department, n.d.).
Salamanca Statement & Framework for Action (1994)	In 1994, Australia endorsed the Salamanca statement & framework for action (1994) that advocates governments to endorse inclusive education in recognition of its value for providing a quality education and building a more inclusive society. The statement lacked an authoritative definition of inclusive education, and was an aspirational document rather than a binding one (Ainscow et al., 2019).
Disability Standards for Education (2005)	The Disability Standards for Education 2005 (DSE) clarified the rights and responsibilities of education providers under the DDA, and introduced the concepts of “reasonable adjustments” and “unjustifiable hardship” into the Australian policy framework (Urbis, 2015).
United Nations Convention on the Rights of Persons With Disabilities (2006)	In 2006, the United Nations Convention on the Rights of Persons with Disabilities (UNCRPD) was published and has since been ratified by 177 signatory countries, including Australia. Article 24 of the UNCRPD articulates the responsibility of governments to pursue an inclusive education (Committee on the Rights of Persons with Disabilities, 2016).
Melbourne Declaration (2008)	In 2008, Education Ministers across Australia committed to a collective aspiration for an excellent and equitable education system. The statement outlines that Australian governments must provide all students with access to high-quality schooling that is free from discrimination based on disability (Ministerial Council on Education Employment Training and Youth Affairs, 2008).
UNCRPD General Comment 4 (2016)	In 2016, the Committee on the Rights of Persons with Disabilities (CRPD) produced general comment 4, a companion document for the implementation of article 24 of the United Nations Convention on the Rights of Persons with Disabilities (2006). General comment 4 provides a definition of inclusion education alongside other models of education. General comment 4—which itself has not been ratified by governments—outlines that inclusion “involves a process of systematic reform embodying changes and modification in content, teaching methods, approaches, structures and strategies in education to overcome barriers” (Committee on the Rights of Persons with Disabilities, 2016).
Alice Springs (mparntwe) Education Declaration (2019)	Following a Nation-wide consultation strategy to refresh the 2008 Melbourne declaration, Education Ministers from across Australia again made a commitment to an education system promoting excellence and equity. The declaration specified that these aspirations meant tailoring to the needs of individual students, including those with disability (Education Council, 2019).

at national and state levels, such as the development of the Nationally Consistent Collection of Data (NCCD) on School Students with Disability and the introduction of a national funding loading for students with disability ([National School Resourcing Board, 2020](#)).

In addition to state and Australian Government legislation, the Australian Government has endorsed and ratified a range of international frameworks to commit to improving educational experiences and outcomes of students with disability. It has also developed a range of supporting domestic legislation and policy to align with these commitments. These are listed in [Table 1](#) below.

These instruments provide a legislative basis for all students to receive an inclusive education with reasonable adjustments in regular school settings. Indeed, families can take education providers to court for failing to provide reasonable adjustments—using the DDA and DSE as the legislative instruments. However, these have not proven effective at changing practice at a systemic level, or promoting a shift to inclusive, regular schools ([de Bruin, 2019](#)). There is no Australia-wide policy which promotes regular school settings as the recommended place for all Australian school students, and there is no inclusive education policy at a national level. The Australian Government does not recognize General Comment 4 as a binding document, noting that it takes General Comment 4 into account when considering its obligations under article 24.

Australian reviews and inquiries

The experiences of students with disability in schools have been investigated in 16 reviews and inquiries at the state and Australian government level over the last decade. These reviews have been instigated by a range of factors:

- Increasing public awareness of the rights of students with disability. Advocacy organizations such as Children and Youth with Disability Australia, All Means All and Family Advocacy NSW have raised public awareness of the experiences of students with disability.

- Impetus to reform. In 2012, the Australian Government introduced the More Support for Students with Disabilities (MSSD) initiative. This promoted the adoption of evidence-based practices and led to a wave of reforms across Australian jurisdictions. It also established a vehicle for states and territories to collaborate on improving educational provision.
- Public awareness and interest following specific incidents. The 2015 *Schools for All Children & Young People* review in the Australian Capital Territory (ACT) was instigated following a high-profile case in a Canberra public school (Shaddock et al., 2016).

These reports considered a range of issues relating to the experiences of students with disability. Reports have distinct terms of reference and oversight arrangements. Parliamentary inquiries, for example, are chaired by parliamentarians and may develop findings and recommendations which are political in context. Across these varying contexts, findings within these reports tend to relate to the experience of students with disability, the practices that support them, and the policy and legislative structures that promote continuing improvement in practice and outcomes.

Table 1 below provides an overview of reviews and inquiries into the experiences of students with disability in Australia between 2009 and 2020. The most recent publicly available inquiry conducted in Western Australia was completed in 2004, and so to ensure coverage across all states and territories, this has been included (Table 2).

The extent to which the recommendations of these reviews and inquiries have been successfully implemented varies. Certainly, there are some notable examples of progress:

- Victorian Functional Needs Assessment—an assessment of student needs which aims to shift the focus of categorical assessment away from medical diagnosis toward the functional needs of the student and the school environment (Victorian Department of Education and Training, 2018).
- The Queensland Inclusive Education policy—an aspirational statement that sets out Queensland's commitment for success and learning among all students. This statement is unique among Australian statements in that it specifies and defines what educational practices are deemed *not inclusive*. Definitions of integration, segregation and exclusion, based on General Comment 4, are provided (Queensland Department of Education, 2018).

However, in many cases progress is difficult to observe and the issues identified in the reports persist.

To increase the pace of progress and improve levels of coordination, Australia's Education Council formed the *Joint Working Group to Provide Advice on Reform for Students with Disability* (Joint Working Group). Since the creation of the Joint Working Group in 2011, there have been some significant advances across Australian school systems which reflect advances in legislation, financing and policy for students with disability.

- The More Support for Students with Disabilities (MSSD) initiative provided short term funding to education authorities in each state and territory over the 2012–2014 school years. It was established to strengthen the capacity and expertise of Australian schools and teachers to provide additional support to students with disability. The initiative supported education systems to trial innovative strategies to achieve the objective with the purpose of stimulating new approaches to inform future developments, and contributed to ongoing streams of reform across school systems (PhillipsKPA, 2015).
- The Nationally Consistent Collection of Data (NCCD) on school students with disability is a framework providing the basis for assessing and financing the provision of adjustments for students with disability in schools (de Bruin et al., 2020). The NCCD was developed collaboratively across all Australian governments, borne out of an agreement that a consistent definition of disability within the school education context was required across States and Territories. The NCCD provides a definition based on the broad category of disability a student has (physical, cognitive, sensory or behavioral) and the extent of adjustments which are required in the classroom as a result (supplementary, substantial and extensive). It also provides the basis for schools to consider how classrooms are structured to support as many learners as possible without the need for additional adjustments, through quality differentiated teaching practice.

Following sustained pressure from Australian advocacy and rights-based organizations, a Royal Commission into Violence, Abuse, Neglect and Exploitation of People with Disability was established in 2019. This Commission, which hereafter in this article is referred to as the Disability Royal Commission, explicitly considers the role of education as both an institution that has historically inhibited the rights of people with disability, as well as a potential force in driving inclusion (Royal Commission Into Violence Abuse Neglect and Exploitation of People With Disability, 2019).

Review and inquiry findings

The Australian legislative framework provides a basis for all students to receive education with reasonable adjustments in regular school environments. While the findings of Australian reviews and inquiries about students with disability reveal examples of inclusive cultures and practices in regular schools, they also provide extensive evidence that this does not often occur in practice (Iacono et al., 2019).

Ultimately, Australia is yet to see a substantial shift toward inclusive education in every school, or for every student—and there remains wide variability in quality among school practices and student experiences. This variation is seen between schools and

within schools. Consideration of reviews and inquiries highlights three consistent themes which align with the framework of practice presented by the CRPD in General Comment 4 and which serve as a basis for summarizing the persistent issues limiting the achievement of inclusive education in Australia.

- Students with disability are segregated. Students—and their families—are either coerced or opt into a segregated system of education.
- Students with disability experience exclusionary practices when accessing or participating in schools, which lead to them attending no school at all, attending part time, or not having the extent of choice which other students in Australia have.

- The model of education experienced by many students with disability is integration. Across schools, there is a failure to provide the reasonable adjustments required for students to receive a fully inclusive education alongside their peers.

This section describes school practices as experienced by students with disability, drawing on the evidence from reviews and inquiries, mapped to these three overarching themes. Proposed solutions offered by reviews and inquiries are also outlined.

Student segregation

Many students with disability participate in separate educational environments to other Australian students, with the likelihood of this increasing as students progress through their schooling. The Australian Bureau of Statistics (ABS) *Survey of Disability Aging and Carers 2018* estimates that approximately 1 in 40 Australian students attend either a special school or class (Australian Bureau of Statistics, 2018). The available data also confirms that participation in mainstream classes decreases as students progress through the school years. For example, the 2018 National Disability Insurance Scheme outcomes report found that 75% of students with disability attended a mainstream school in years Foundation–2, with this figure reducing to 65% in years 3–6 and to 42% for years 7–10 (National Disability Insurance Scheme, 2019).

It is well established that the school setting shapes an individual's educational experiences and outcomes (Hehir et al., 2016). However, there is a consistent lack of evidence to suggest that segregated schooling is more beneficial than inclusive settings for students with disability. Within an Australian context, no reviews or inquiries to date have published original research into the impact of segregated schooling on student outcomes. All Australian jurisdictions continue to offer segregated education for students with disability.

To date, the terms of reference for inquiries and reviews have not explicitly considered the prevalence or impact of segregated schooling on subsequent life outcomes. Following sustained pressure from advocacy and rights-based organizations and an increasing awareness of the issues associated with the practice, student segregation was brought into consideration of the Disability Royal Commission (Royal Commission Into Violence Abuse Neglect and Exploitation of People With Disability, 2019). It is expected that over its course, the Commission will consider the role of segregation in Australian education systems and prepare recommendations for future consideration for all Australian governments.

Issues raised in reviews and inquiries

Reviews and inquiries have indicated that a parent/carer's decision to place their child in a special school or program may be driven by the absence of tenable options within the mainstream education system (Australian Senate, 2016). The current Australian emphasis on parent/carer choice in education settings presupposes that families have access to meaningful information that informs their choice. In reality, however, families may not have access to relevant information, such as in relation to the benefits of inclusive education (Deloitte Access Economics, 2017; Tah, 2020; Mann et al., 2015). Further, when parents experience exclusionary practices from schools, such as enrollment dissuasion (also known as gatekeeping), their perceptions of attractiveness and viability of mainstream options are impacted (Mann et al., 2015).

Recommendations

To enable informed and tenable family choices, reviews and inquiries have recommended improving school community understanding of the benefits of inclusive education—to better enable informed choices among students and their families (Deloitte Access Economics, 2017). Reviews have also emphasized that mainstream education should be conveyed as the primary education placement for *all* students (Victorian Department of Education and Training, 2015; Deloitte Access Economics, 2017; New South Wales Legislative Council, 2017; Center for International Research on Education Systems, 2018).

Recommendations have also focused on redirecting resources to ensuring mainstream school systems can become more inclusive so as to improve educational options for families of students with disability (DEEWR, 2010; Victorian Department of Education and Training, 2015; Deloitte Access Economics, 2017).

Student exclusion

Exclusionary practices encapsulate a range of discriminatory practices that limit equitable access to education for students with disability. Exclusionary practices apply to access and engagement at all stages of a student's educational journey. These include discriminatory enrollment practices, disproportionate disciplinary practices, and restrictive practices (restraint and seclusion).

Issues raised in reviews and inquiries

Australian reviews and inquiries indicate that exclusionary practices are commonly—and in some cases routinely—applied by schools across a student's educational trajectory. However, rigorous data does not exist to quantify the incidence of these practices. A yearly survey conducted by Children and Young People with Disability Australia reports that exclusionary practices take place in all states and territories (Children and Young People with Disability Australia, 2019).

Evidence from reviews and inquiries also sheds light on the attitudes, perceptions and knowledge of educators that underpin these exclusionary practices. In particular, low expectations of students with disability were regularly cited in reviews and inquiries as contributing to exclusionary enrollment practices, while schools' insufficient understanding of how a student's disability

influences their behavior is noted in reference to the use of suspension, expulsion and restrictive practices. It should be noted, however, that no terms of reference in recent reviews and inquiries explicitly considered educator workforce attitudes or school culture.

Enrollment practices

Upon seeking to enroll within a school, families of students with disability may experience subtle or explicit dissuasion to enroll, a practice known as “gatekeeping.” This can manifest in multiple ways, including granting enrollment on a conditional basis only (such as forced part-time enrollment) or through school staff dissuading a parent/carer from enrolling their child by referencing the school’s resourcing limitations, including referencing catchment zone limitations or subtly expressing low expectations of students with disability (Castan Center for Human Rights Law, 2018; Australian Senate, 2016). There is an inequitable onus on families of students with disability to navigate the education system, secure education support, and advocate for necessary supports for their child (Human Rights and Equal Opportunities Commission Victoria, 2012; Parliament of Victoria, 2017).

Disciplinary practices, such as suspension (temporary removal from a school environment) and expulsion (permanent removal from a school environment) can be detrimental to the mental health, wellbeing and social adjustment of students with disability. Students and their families, along with peak bodies, reported that suspending and expelling students with disability reinforces difference, segregation and stigma associated with ability (Hehir et al., 2016; Human Rights and Equal Opportunities Commission Victoria, 2012; Parliament of South Australia, 2017). The 2015 *DSE Review* noted that suspension or expulsion from the learning environment impacts on the student’s continued learning and integration into the social structures (Urbis, 2015).

In addition to the impacts on students with disability and their families, several reviews noted that traditional forms of disciplinary practice were ineffective at changing behavior (Shaddock et al., 2016; Deloitte Access Economics, 2017; Parliament of South Australia, 2017). Consultation with one teacher for the *Queensland Review of education for students with disability* found that “suspensions give us a small amount of respect, but they don’t resolve the issues” (Deloitte Access Economics, 2017).

The immediate inappropriate response of punishing a student with disability for challenging behavior can be circumvented through a shift in perception and behavior—that is, by ascertaining the underlying causes of challenging behavior and putting in place the appropriate supports to address these (Sackville, 2020).

Restrictive practices

While reviews and inquiries stress that restrictive practices should be reserved as a “last resort” intervention, to be used only once all other options have been exhausted and to protect the safety of staff and students, they also found many instances of restrictive practice being misused (DEEWR, 2010; Deloitte Access Economics, 2017; Australian Senate, 2015). The use of restrictive practices is widely known to be an ineffective intervention in instigating behavior change and contravenes the rights of the young person (Parliament of South Australia, 2017; Iacono et al., 2019; Poed et al., 2020). A common theme in reviews, inquiries and indeed contemporary Australian literature is that restrictive practice is misused as a disciplinary, or behavior management, tool—that is, in some cases, normalized (Australian Senate, 2015; Human Rights and Equal Opportunities Commission Victoria, 2012; Australian Senate, 2016; Poed et al., 2020). Surveys estimate that between 16% (Children and Young People with Disability Australia, 2016) and 25% (Poed et al., 2020) of students with disability experience restrictive practices.

The prevalence of restrictive practice misuse is attributed to limited system-level guidance and leadership (Deloitte Access Economics, 2017; Human Rights and Equal Opportunities Commission Victoria, 2012; Parliament of South Australia, 2017; Castan Center for Human Rights Law, 2018; Poed et al., 2020). Specifically, there is insufficient guidance on how and when restraint can be used in schools.

Recommendations

Exclusionary practices are in breach of national and international obligations, reflect low expectations for the potential achievements of students with disability, and are enabled by the limited guidance, oversight and accountability mechanisms at the state/territory level and more broadly at a national level.

Recommendations outlined in reviews and inquiries focus on levers relating to accountability and governance and policy guidelines. Specifically, reviews and inquiries recommend:

- Improved collection and analysis of disaggregated data on suspensions and expulsions, part-time enrollment arrangements, and restrictive practice (Deloitte Access Economics, 2017; Australian Senate, 2016)
- Adoption of national rules around excluding students with disability within schools (Australian Senate, 2015)
- Improved information sharing of parents/carers’ rights, obligations and complaints processes regarding enrollment (Tasmanian Department of Education and Training, 2015; Parliament of South Australia, 2017; Deloitte Access Economics, 2017; Human Rights and Equal Opportunities Commission Victoria, 2012; Urbis, 2015)
- Adoption of clear principles and guidelines regarding the use of restrictive practice, and minimization and eventual elimination of these practices through a revision of system policy and workforce capacity (Deloitte Access Economics, 2017; Australian Senate, 2015; Parliament of South Australia, 2017; Australian Senate, 2016; Human Rights and Equal Opportunities Commission Victoria, 2012)

- Adoption of clear guidelines regarding suspension and expulsion of students with disability, and increased accountability of the discriminatory use of these practices (Glass, 2017; Parliament of South Australia, 2017; Human Rights and Equal Opportunities Commission Victoria, 2012).
- Adoption of innovative approaches that focus on prevention and limiting the need for disciplinary and restrictive practice, such as schoolwide positive behavior support (Glass, 2017; Parliament of South Australia, 2017; Human Rights and Equal Opportunities Commission Victoria, 2012).

Integration

The CRPD defines integration as the process of “... placing persons with disabilities in existing mainstream educational institutions, as long as (students with disabilities) can adjust to the standardized requirements of such institutions” (Committee on the Rights of Persons with Disabilities, 2016). The concepts of integration and inclusion are not always clearly distinguished from each other and are often used interchangeably (UNICEF, 2012). Across the course of their educational experience, students may experience aspects of their education which resemble inclusion and integration.

Integration can contribute to poor experiences of students with disability and their peers. An outcome of integration is that students opt to transition into segregated environments or leave education entirely (Mann et al., 2015).

Issues raised in reviews and inquiries

Evidence from reviews, inquiries and contemporary literature indicates that students with disability who participate in education within a mainstream setting may not receive adequate support and adjustments necessary to truly access and engage with the educational program. This means that the form of education they are experiencing may be closer to integration than inclusion, using the General Comment 4 model.

One such issue is the excessive use of alternative curriculum. This issue is illustrative of the experience of integration in an educational setting, however is by no means exhaustive.

Alternative curriculum

All schooling systems across Australia either implement the Australian curriculum or a similar curriculum system. For students with disability, it is considered effective practice to develop adjustments where students access the same curriculum as their similar-aged peers. However, where students struggle to access despite the provision of reasonable adjustments, it is also considered appropriate to deliver curriculum which is selected from a different year level to the student, or selected from the general dimensions to the curriculum (Swancutt et al., 2019).

However, the use of alternative and modified curriculum and assessment practices has been raised as a key concern in reviews and inquiries (Urbis, 2015; Castan Center for Human Rights Law, 2018; Iacono et al., 2019; Deloitte Access Economics, 2017; Parliament of South Australia, 2017). For example, there is evidence that instead of modifying curricula to suit individual needs and capabilities, some teachers merely reduce the difficulty and rigor of work tasks or reduce workloads, which can result in learning activities that do not hold educational value (Urbis, 2015; Castan Center for Human Rights Law, 2018).

Over time, these practices can have significant impacts on student life outcomes. Employment opportunities may be limited by a focus on “special” curriculum that is exclusively developed for students with disability, which can eventually lead to social exclusion, lower levels of health and an overall life of disadvantage (European Agency for Special Needs and Inclusive Education, 2018; Castan Center for Human Rights Law, 2018).

Recommendations

While these adjustments may be implemented in line with an agreed method of practice, it is important to know which students are receiving modified curriculum, and ideally why. At present there is no national view on the distribution of these types of arrangements, and at the time of publication, no state or territory educational authority appears to publish the use of these arrangements.

Reviews and inquiries in Australia have recommended the following:

- Better information on access to curriculum and assessment modifications (Australian Senate, 2016)
- Consistent reporting on the use of alternative curriculum—including standard curriculum delivered at a different year level, and pre-foundational or alternative curricula (Deloitte Access Economics, 2017)

Such policies could enable improved information sharing, research, and potentially support regulation of practices. In the United States, for example, access to modified curriculum is regulated through the Individuals with Disabilities Education Act, which specifies that district educational authorities are permitted to measure up to 1% of their students against alternate achievement standards, and 2% against modified achievement standards (Mitchell, 2015).

Review design considerations

The previous section has shown that Australian governments have conducted numerous reviews into inclusive education. These reviews have highlighted the experiences of students with disability and provided a framework for advancing the interests of students with disability.

Yet, despite some notable exceptions, there has been little meaningful progress in either outcomes or policy to support inclusion of children with disability across Australian schools. While the need for, and elements of, reform may be clear from these reviews, significant barriers to progress remain.

The reasons for this are complex and broad-ranging. Indeed, in General Comment 4, a framework of attitudinal, technical, financial and legal barriers to progress is presented. Any one of these areas would be deserving of its own article, and it is not possible to provide a full description as part of this article. Instead, noting that the topic of this article is reviews of education, this article will seek to describe the barriers inherent in the design, implementation and publication of the reviews themselves. This is presented in the hope that the lessons can be instructive in the design of future policy reviews.

While there has been no public acquittal of major Australian reviews, in some cases there is limited evidence that the advice provided to governments has been acted on or even considered. This can be damaging—it leads to wasted effort of governments, independent reviewers and stakeholders. It represents further unproductive use of the time of teachers and school leaders who generously contribute to review processes. Ultimately, failure to act diminishes public confidence in the effectiveness of any review process. Minor improvements to the way in which such reviews form and present recommendations, as well as the systems used to act on them, may improve the way in which Australian jurisdictions consider review findings.

Independent review processes

To the greatest extent possible, reviews should be conducted in a manner completely independent from the government and bureaucracy whose actions are subject to review. They should be conducted in line with a transparent set of criteria or terms of reference—to enable scrutiny of the methodology and findings.

This is to avoid the possibility of findings or recommendations being developed which are based on political acceptability, convenience or fiscal considerations, or indeed to avoid the perception of this.

In Australia, many of the landmark reviews have been conducted by State or Federal Parliaments. While these may be separate from Government, they cannot be said to be truly independent, as they are conducted by committees with representation from ideologically oriented political parties.

Clear ownership of recommendations

To have the greatest effect, recommendations should be concise, evidence-based, and have a clear “owner” responsible for taking those recommendations forward (National Health and Medical Research Council, 2020). Despite the careful planning and complex stakeholder negotiation informing reviews and inquiries, the subsequent recommendations are not always actionable, and in some cases do not clearly assign responsibility and accountability for action. This can lead to wasted effort in the development and consideration of recommendations.

In some instances, the specific body responsible for acting on recommendations is not clear. This is, in part, driven by the federated structure of education within Australia. Under Australian law, states and territories hold responsibility for delivery of education. There are a complex set of bodies, at federal and state levels, who may have responsibility for acting on recommendations arising from reviews which consider education. The history of reviews conducted at a federal level shows the difficulty in subsequently acting on the recommendations outlined.

- A 2016 Senate inquiry recommended the adoption of a national database on access and attainment for students with disability (Australian Senate, 2016). This recommendation was *accepted in principle*, with the response stating that the Australian Government would work with Education Council to develop specific details. However, since that response was issued, this has not been discussed as an item at Education Council (Australian Government, 2017).
- That same inquiry recommended a national strategy to improve education for students with disability (Australian Senate, 2016). The Australian Government also accepted the recommendation in principle, noting that the responsibility lay with State governments, and highlighted an existing patchwork of strategies which worked toward this end. There has been no specific progress in developing a national strategy around education.

In some instances, the responsible body may be clear, but the nature of recommendations put forward by the review can be challenging. Some reviews have resulted in recommendations which do not outline specific actions that can be easily acquitted. For example, in 2017, the *South Australian Select Committee on Access to the Education System for students with disability* delivered its report. This report contained over 80 recommendations, without a clear organizing framework. Among these recommendations were a number of aspirations for improvement, rather than specific recommendations for action (Parliament of South Australia, 2017). In these circumstances, it may be difficult for an authority to determine the specific actions sought, and develop a response.

Guidance provided by the National Health and Medical Research Council indicates that greater specificity in recommendations, including the body responsible or accountable for actioning recommendations, will help those recommendations to be received and actioned appropriately (National Health and Medical Research Council, 2020). This may facilitate progress toward more inclusive education structures, and ensure the efforts of all involved in conducting reviews—reviewers, governments, research participants and sector stakeholders—are put toward a productive end.

Accountability for acting on recommendations

Following a review or inquiry, action can be prompted by mechanisms that support implementation of relevant recommendations. Some government agencies have not established effective mechanisms for these purposes.

Some recent examples of Australian reviews have recommended the establishment of an administrative function and accountability/oversight board to ensure the steady adoption of recommendations (Shaddock et al., 2016; Deloitte Access Economics, 2017). It is important to note that forming such recommendations relies on an understanding of the context of the responding government authority and is based on a shared understanding of the role and remit of the independent reviewer.

Most of the reviews identified in Table 1 above do not have corresponding public acquittals against the implementation of recommendations. In some cases, there is a degree of opacity around the status of acceptance of the recommendations—where governments may not prepare a formal response to a review or inquiry, or do not accept the recommendations of a review. For example, the 2017 South Australian Parliamentary Inquiry, and the 2018 report into Policy and Practice for students in NT schools, do not appear to have corresponding public government responses (Parliament of South Australia, 2017; Center for International Research on Education Systems, 2018).

However, there are examples of reviews where the status of recommendations is scrutinized by an independent authority. A year following their inquiry into school expulsions in Victoria, the Victorian Ombudsman publicly released an acquittal against implementation of those recommendations, classifying recommendations as “implemented,” “in progress” or “not implemented.” The ACT Government publishes a regular communique on the implementation of the recommendations following the “Schools for All” review (Australian Capital Territory Education Directorate, 2020).

Establishing independent mechanisms for scrutinizing the status of review recommendations may increase the likelihood that those recommendations are acted on.

Conclusion

Australian governments have conducted numerous reviews into inclusive education. These reviews have highlighted the experiences of students with disability and provided a framework for advancing the interests of these students.

This article provides a summary of the experiences facing many students with disability across Australia. Across all states and territories, students are placed in segregated educational facilities, excluded from accessing and participating in learning, and not supported through differentiated teaching practice.

These issues associated with the experiences of students with disability have been widely cataloged and are well known at this stage. In addition, the necessary changes have been articulated through hundreds of recommendations at state and federal levels and are reasonably well understood. However, there has been little progress in action at a national or state level—challenges remain with implementation. To support implementation, it is important to establish the right conditions for change from the outset in any review process. Future reviews and inquiries into these matters can overcome some of these challenges through adoption of strict independence in review processes, establishing accountability and responsibility at the right levels, ensuring buy-in across stakeholders, and committing to public release and acquittal of all report recommendations.

Introduction

When inclusive education was established as an international policy through the Salamanca Statement (UNESCO, 1994), it was seen as a radical shift that would not only improve the situation for pupils traditionally falling under the scope of special education, but be conducive to alter education in general and the future society in particular (Ainscow et al., 2019). Developments in the almost 30 years since the signing of the Salamanca Statement have been complex and several promising international policy initiatives have followed. However, the implications for traditional understanding of the organization of schooling and teaching have varied greatly (de Bruin, 2019) and, in some countries, politicians, parents, and even teacher-unions increasingly question inclusion. This questioning often regards the efficiency of inclusion with respect to increasing educational attainment, as a matter of resources, as a matter of teacher proficiency, and as a matter of stigmatization or *othering*.

The sporadic development of inclusive education has several different reasons. One reason is the conceptual confusion surrounding inclusion, both as regards *whom* it focuses on and *how* it is to be organized (Magnússon, 2019). Also, the concept of inclusion has become positively loaded, in a similar manner as words such as democracy and liberty may be (Nilholm, 2006). As such, inclusion risks suffering the fate of elevator-words (Hacking, 1999), in the end not really referring to objects in the world, but giving a positive shine to that which it is attached to. For some proponents, inclusion therefore seems to have been kidnapped, rendering it meaningless (e.g., Skrtic et al., 1996), or as Slee expressed his concern: "... *that inclusive education is a casualty of a form of 'eduspeak' characterized by reductionism and disconnection and devoid of its original political intent*" (Slee, 2008, p. 104). Indications of this can be seen in how inclusion is used to signify a broad range of organizational practices, some of which are forms of segregation. Its radical political origins thus risk disappearing into oblivion (Slee, 2011).

However, semantics can only explain so much, there are material and organizational factors to account for as well. For instance, the European Agency for Special Needs and Inclusive Education has pointed to a lack of stable and longitudinal financial commitments and investments to further inclusion (Meijer and Watkins, 2019) which is likely to add to the stress of overworked teachers and the exposure of pupils who do not receive the support they need. Inclusion can also be seen as deprioritized in a political landscape that values and promotes economic efficiency, accountability, and standardization, (Apple, 2012; Blossing et al., 2014), and where position on international test measurements are seen as a national priority (Mølsted and Pettersson, 2019). This latter development has been explained as the result of increased power of supranational policy-actors (Daun, 2011), global policy-networks (Ball, 2012), and international policy-borrowing (Steinar-Khamisi, 2004). It is also the case that inclusive education was intended to be promoted by supranational policy-actors, policy-networks, and policy traveling and borrowing. This would indicate that inclusive education needs to be viewed in a broader policy-context where it competes for prioritization (Magnússon et al., 2019).

The varying successes of inclusion as education policy must therefore be analyzed more thoroughly, particularly if one wishes to promote inclusion as an important, democratic and radical alternative to traditional educational organization and education politics. Such analysis is the objective of this article, using Sweden as a case, with the premise that inclusive education is of relevance for several different types of practice (e.g., policy, research and schooling) and that within all of these fields, different actors view inclusion from different perspectives and with different needs and intentions.

Sweden is often raised as a beacon of inclusion in an international perspective (OECD, 2011, 2015). However, a series of market-oriented reforms in the past 30 years have contributed to increased segregation and decreased equity in the education system (Magnússon, 2015, 2020). Even more conspicuous with respect to the erosion of inclusion, is a recently instigated government inquiry (Swedish Government Official Reports 2020:42, 2020) for more segregated solutions within the school system, using

the government sanctioned sentence *“the idea of inclusion has gone too far”* as a point of departure. This theme has in fact been increasingly prevalent in public debate about education in Sweden (Bagger and Lillvist, 2021). Hence, it can be argued that Sweden lives in a tension between its tradition of emphasis on social cohesion and inclusion, and a political hegemony emphasizing market-ideology of competition and efficiency (Magnússon and Pettersson, 2021).

In this chapter I will discuss fields of tension within inclusive education, and give examples of how these appear within research. I will then explain my theoretical approach to the concept. Thereafter, the Swedish education system is briefly described. Then, I will illustrate my argument about inclusion as a traveling international education policy embedded in a national and local policy context, with a summary of research and statistics from different levels of the Swedish education system. Finally, some conclusions will be drawn.

Fields of tension

The thoroughly discussed conceptual complexity of inclusive education can be partly explained by the broad application of the concept and its relevance to different types of practices on different levels. Besides being a policy-concept on international, national, regional and local levels, inclusion is also relevant to a large and diverse field of research and of course to the practical organization of education and teaching. For the aims of this article, inclusive education is viewed as a political ideal of education. As a political ideal, inclusive education embraces distinct normative beliefs about the purpose, the content, and organization of education. However, as I will illustrate below, inclusion as a field of research reflects neither a single nor homogenous ideology, but a range of understandings, not always explicitly stated, that vary greatly in both theory and practice (Avramidis and Norwich, 2002).

Inclusive education also encompasses several fields of tension. One of these fields concerns *who* is the focus of inclusion; which pupil-groups or population cohorts are identified as excluded and in need of being “included” (Florian, 2008; Hansen, 2012; Nilholm, 2006). In its broadest definition, the recognition of particular pupil-groups may be left outside the discussion and a general inclusive ambition raised focusing on democratic communities for “all” pupils. However, such approaches implicitly define pupil groups as not belonging to “all” pupils right now, and thus in need of politics and policies to be included (Popkewitz, 2009). The question of recognizing particular pupil groups pertains to a second field of tension that regards the relationship between inclusive education and special education (Magnússon, 2015). Some researchers argue that an identification and categorization of educational difficulties is in itself an excluding practice which often leads to pathologizing of pupil difference; hence it is antithetic to inclusion (e.g., Haug, 1998; Vislie, 2003; Thomas and Loxley, 2001). The argument is that the explanation of problems within the organization of schooling with individual characteristics of pupils—rather than contextual or organizational factors—will only reproduce the marginalization of vulnerable pupils (Skrtic, 1991; Ainscow, 1998). This approach to inclusion contains a radical questioning of the legitimacy of special education (Magnússon, 2015). However, other researchers argue that the political project of inclusive education should focus on pupils with special educational needs (e.g., Kiuppis, 2013; Miles and Singal, 2010), both due to the historical origins of the political process (Kiuppis, 2013) and to ensure that the particular needs of pupils with disabilities are not rendered invisible (Florian, 2019). Such an approach would be of particular importance in countries where access to education is limited in general and for pupils in need of special educational support in particular (Miles and Singal, 2010).

Over time, the meaning of inclusive education has become more encompassing, increasingly focusing on the notion of creating inclusion for “all children” (Kiuppis, 2013; Florian, 2019). An example of such widening focus of inclusion is found in Hope and Hall (2018) where inclusion is related to the experiences of LGBTQ students in a school specifically (and exclusively) accommodating LGBTQ students. It could therefore be argued that inclusion has developed into a political tool to acknowledge a variety of disadvantaged student groups (Engsig and Johnstone, 2015).

That relates to a third field of tension regarding how inclusive education should be organized and practiced. Several researchers have argued that inclusive education must not be reduced to the placement of the pupils (Ferguson, 2008; Haug, 1998; Slee, 2008; Thomazet, 2009; Vislie, 2003) and that “mainstreaming” (the placement of pupils in need of special support in regular classrooms) risks leading to experiences of exclusion if the placement is not accompanied by organizational resources and pedagogical measures to address the culture of the school and the participation of the pupils (Haug, 1998; Slee, 2011; Vislie, 2003). The question remains: how can research address inclusion both as a matter of mapping different practices and as a matter of improving inclusive education in everyday schooling (Göransson and Nilholm, 2014; Nilholm, 2020)?

It is therefore interesting to note the existence of a wide range of interpretations of the organizational conception of inclusion in research. For instance, Göransson and Nilholm (2014) noted four types of definitions of inclusive education among the most frequently cited research articles, spanning from a focus on the placement of SEN pupils in regular classrooms (mainstreaming), to the more abstract focus on “creating communities” for all pupils.

Later Nilholm and Göransson (2017) noted different definitions of inclusion in different types of research. Large-scale empirical and statistical studies usually used a placement-definition of inclusion, whereas theoretical and small-scale, qualitative articles used broader definitions. This finding was later confirmed by another study (Amor et al., 2018). This conceptual divide between different types of research can be understood through the following suggestion: different types of research need different conceptions of inclusion in order to operationalize it as, for instance, an analytical concept, a theoretical construct, or as a measureable variable. Large-scale register-studies or experimental studies need observable relationships between distinguishable variables, for example: the placement of pupils on the one hand and the knowledge-attainment or student learning outcomes on the other. In small-

scale qualitative studies or theoretical developments of the concept of inclusion, broader and more abstract definitions are more applicable, or can even be the result of the inquiry. This variance can be seen as a challenge for inclusive education as a research field (Göransson and Nilholm, 2014), but it also illustrates inclusive education as a political project lacking a common goal specifically formulated for practice. Thus, further studies of how inclusion is conceptualized as a political project in policy, are needed.

Inclusive education as policy

There are a number of ways to view inclusive education. For instance, it can be seen as:

- a matter of bureaucratic organization—where the prerequisites for different pupils' education are regulated;
- as a matter of teaching and the practical choices of teachers;
- as a matter of philosophy regarding definitions of equity or what is "just" or "right"; and
- as a matter of activism and ambition to improve conditions for either specific pupil-groups or all pupils.

While I see a value in each of these perspectives, here inclusive education is viewed as education policy. Viewing inclusion as policy allows us to investigate its political statements about practice, organization and teaching. Each of these statements are in turn influenced by different philosophies and activism in different spheres and at different levels of policy-making and enactment. It also emphasizes the importance of policy on international, national, regional and local levels, and as negotiated and enacted on all levels.

Education policies illustrate political intentions and ideas about education, its aims, implementation and priorities. Policies are also inherently political as they concern distribution of resources, power and representation within the social field of education (Apple, 2004). Here, I follow Ball's definition of policies as statements about practice, "*intended to bring about idealised solutions to diagnosed problems*" (Ball, 1990, 26), a "*tinkering toward utopia*" of sorts (Tyack and Cuban, 1995) where political ideals about both society and education, are more or less explicitly stated. Hence, besides regulating and defining the framework of educational practice, education policies express assumptions about how pupils are to become citizens of and for society, and how that future society is to be constructed (Popkewitz, 2009).

Economic fluctuations and ideological issues, that change over time influence political ideas about education (Apple, 2004) and as political majorities shift, some policies prevail whereas others perish. However, policies are rarely written by sole actors, especially as regards education where longevity of policies is seen as a stabilizing factor for the education system. Policies thus often contain series of compromises between different political and non-political actors (Ball, 1993). This often leads to contradictory goals or measures that schools and staff must find ways to enact (Ball et al., 2012).

Tracing particular international policies and their consequences in practice, requires an analysis of the tension between general commonalities and local particularities. Any analysis of the traveling of international policies and political agendas is therefore not simply a matter of tracing implementation, but rather a consideration of the contextualization of the policies at different levels and among different actors. An international policy discourse doesn't translate directly into policy texts or practices in its original form, but is rather received and interpreted differently in varying national and regional contexts, constructed of political architectures, infrastructures, ideologies and institutions (Ball, 1998) and subsequently translated and enacted in local educational organization and practice. Wahlström and Sundberg (2018, p. 171) illustrate such traveling through a complex theoretical model, the points below being a modified, with the addition of the level of teacher-training, and simplified version of their model, using inclusive education and Sweden as an example. The list is not intended to be neither a normative hierarchy nor a chronological account. Rather it sketches some of the important levels a transnational policy transfers through.

- Inclusion is formulated as transnational policy at an international level by supra-national institutions (e.g., Salamanca Statement by UNESCO).
- Inclusive education is embedded in a context of political policies, organizational structures and traditions at the national level (e.g., Swedish education policy), where it competes for prioritization among other policies.
- Inclusive education becomes a subject of teacher-training, entering different organizational contexts and traditions, competing with and entered into other subjects (such as special education). Teacher-training is viewed here as an important level of policy transmission in education as it translates curriculum and legislation into the vocabulary and practices of future teachers.
- Inclusive education becomes a matter of policy making at the municipal level, or principal organizer level for privately run schools. In the decentralized Swedish education system, this is the level of resource allocation and organizational prioritizations, that will influence the practical and fiscal prerequisites for inclusion.
- Inclusive education becomes a matter of school-level and classroom-level practices where it is enacted in everyday work by individual teachers, principals, special educators and other staff, parents, and students. Each of these groups may have different interpretations of the concept of inclusion, but still have to enact and cooperate around it.

The Swedish education system

The Swedish education system encompasses preschool (ages 1–5 years) through primary school (6–16 years), to upper-secondary school (16–19 years), and adult education. Education is publicly funded and free of charge at all levels, with the exception of

relatively low and income-related fees for preschool attendance. The concept of “pupil in need of special support” is central with regard to the provision of special education in the Swedish education system (Swedish Code of Statutes, 2010: 800). While the legislation emphasizes attainment of knowledge-goals as a primary indicator of need for special support, “other reasons” such as behavioral and social difficulties are also mentioned. The concept of special educational support thus encompasses a broad array of pupils in Sweden, that is, pupils with disabilities/diagnoses, learning difficulties, and pupils encountering difficulties reaching the knowledge-goals for a variety of other reasons. When suspicion of need for more extensive support arises, principals are legally accountable to initiate investigations and to secure documentation and ensure procedures for interventions are established and followed (Swedish Code of Statutes, 2010: 800 § 3, 5, 7–12). To a certain extent, this means that principals define and interpret what support is to be provided, to whom, and how. It is also of relevance that the Swedish system has several parallel educational tracks, for example state run special schools for pupils who use sign language due to hearing disabilities, and two types of schools for pupils with learning disabilities and severe learning disabilities (a diagnosis of intellectual disability is needed).

The concept of inclusion is not mentioned in the Swedish Education Act, (Göransson et al., 2011; Isaksson and Lindqvist, 2015), but it stipulates that special educational support should primarily be provided in the “regular” classroom if possible and that segregating measures deemed necessary should be temporary and restricted to particular subjects. Recent statistics show that roughly 1% of pupils are educated in segregated groups within their schools and that the proportion grows exponentially over age groups, with approximately 3% of the oldest primary school pupils receiving segregated support (Swedish National Agency for Education, 2018). As Magnússon et al. (2019) argue, one reason may be that inclusion is just one educational policy ideal among others and must be viewed in the general context of education policy and political prioritizations. One such factor is the increasing social segregation in the system which can be related to far-reaching market-reforms that shifted the focus of the education system from equity to efficiency (Magnússon and Pettersson, 2021). An example of the reduced ambitions for inclusion is the above-mentioned government report, investigating the possibilities of more segregating solutions in the school system, primarily “resource-schools” (i.e., temporary schools) and special-classes/groups (Swedish Government Official Reports 2020:42, 2020). This report follows both political prioritizations and increasingly negative public discourse in political debates on education (Bagger and Lillvist, 2021).

The education reforms that introduced marketization in the Swedish education system reflected concurrent international trends. The argument was that competition would lead to higher attainment, a plurality of actors and pedagogical development, and more efficiency (Daun, 2003; Lundahl, 2005, 2010). Thus, the system was decentralized, shifting the ownership and fiscal responsibility of schools from the state to municipalities and school-choice was introduced allowing private actors as principal organizers to own and run independent schools. From a policy perspective, independent schools are equivalent to municipal schools; they are subject to the Education Act and the state-defined curricula, and must fulfill the same goals as municipal schools (Swedish Code of Statutes, 2010: 800) with some exceptions. The municipalities finance pupils’ education from preschool through upper-secondary school, via vouchers, a sum that covers expenses for the pupil’s education at his/her school of choice and no additional tuitions or fees are allowed. Thus, pupils are in principle able to choose between different municipal and independent schools, although the supply of choices varies regionally. Some independent schools are profiled specifically toward pupils with different diagnoses (Swedish National Agency for Education, 2014; Magnússon, 2015) and while independent schools are supposed to be open to all pupils, different profiles and marketing strategies affect who applies to individual schools, and they have a legal-opening to refuse admittance to pupils with special needs.

From the international arena to local practices

In the following sections, I will summarize recent research, with a focus on Sweden to illustrate the complexities of how inclusion travels from an international policy to practice. The structure follows the description in the theoretical section of the article:

- an in-depth analysis of the Salamanca Statement (UNESCO, 1994);
- a contextualization of inclusion as an education policy among other Swedish policies;
- an example of how inclusion is organized in teacher-training;
- discussion of how different municipalities and principal organizers organize work of relevance to inclusion; and
- discussion of how different professions approach inclusion in the Swedish system.

Inclusion as international policy—the ambiguities of the Salamanca statement

The Salamanca Statement is a prime example of an international policy intended to influence national policies and local practices. As regards the development of inclusion, the Statement can be seen as the most important and most-referred to document, despite later developments of important international policies (Graham et al., 2020). However, despite the fact that the Salamanca Statement constitutes a foundational reference in both policy-making and research on inclusive education, its definition of inclusive education is not clear, neither as regards *who* is in focus of inclusion, nor as regards *how* it should be organized. A recently published article (Magnússon, 2019), analyzed the Salamanca Statement, illustrating how inclusion is not only formulated as a solution of the particular educational problem of arbitrary segregation of pupils to special educational provision within contemporary schooling, but also as a solution to problems of future society via the formation of future citizens. Thus, schools are not only supposed to

educate children in particular subjects, but also to raise democratically thinking, tolerant, inclusive, and employable citizens that will participate in the future democratic society.

The Statement is also permeated by several different types of political ideals, of conservative, liberal and left-wing origins (Magnússon, 2019). For instance, education is both formulated as a public good, necessary to construct the future democratic society, and as a private good, where parents are described as privileged partners who should exercise choice. The arguments to motivate inclusion are even embedded in economic terminology, such as efficiency and cost-effectiveness, along with ethical and democratic justification of the suggested political objectives.

As regards *who* is in focus of the statement, its roots in special education are clear, the subtitle being “Framework for Action on Special Needs Education”. The document is therefore largely focused on pupils with different disabilities and learning difficulties. Therefore, using the Salamanca Statement, one could argue that inclusion is about what would be termed pupils in need of special support in Sweden. However, the Statement also states that:

... schools should accommodate all children regardless of their physical, social, emotional, linguistic or other conditions. This should include disabled and gifted children, street and working children, children from remote or nomadic populations, children from linguistic, ethnic or cultural minorities and children from other disadvantaged or marginalized areas or groups.

UNESCO (1994, 6).

In other words, inclusion can also be regarded as encompassing “all children”, albeit with a focus on children seen as disadvantaged. All of the groups mentioned above can be said to fall outside the norm of the exemplary pupil, so the Statement can be said to both define the “normal” or “desired” pupil, along with pupils seen as excluded. Hence, the Statement can be seen as formulating the idea of “*who ‘we’ are, should be and who is not that ‘we’*” yet (Popkewitz, 2009).

As regards the organization of inclusion, the Statement’s Framework for Action, includes guidelines ranging from policy to teaching, services, teacher-training and material resources. While the overarching concern is access (of children with disabilities) to education, the Statement also argues for attendance in the same schools and classrooms. A narrow interpretation of the Statement could therefore view inclusion as primarily a matter of placing pupils with disabilities in regular schools and classrooms. However, the Salamanca Statement provides ample room for interpretation, allowing for segregated educational provision and limitation to placement. The Statement urges governments to enroll all children in regular schools, “*unless there are compelling reasons for doing otherwise*” (UNESCO, 1994, ix) and that every person with disabilities should have the right to express their wishes regarding education “*as far as this can be ascertained*” (UNESCO, 1994, 6). Some additional articles discuss the necessity of separate educational provisions in special schools and establishments for particular individuals, or pupils with particular disabilities (Magnússon, 2019, 686). In other words, the Statement can also be used to argue for segregated educational provision based on categories of difference.

The summary of Magnússon’s analysis states that the notion of inclusion in this international and influential policy-document “*encompasses a range of ideals and generally formulated decrees for educational practice*” ranging from “*specific definitions and focus on the placement of pupils with special needs or disabilities in regular classrooms, to broader ideals of ‘creating communities’ for all pupils*” (Magnússon, 2019, 687). There are arguments pertaining to different political ideologies—it is an “*amalgam of ideals*” that “*allows for a multitude of interpretations of what inclusion can mean*” (Magnússon, 2019). The conclusion is that this may be by design. An international policy that wishes to influence several hundred national and regional education systems needs to be malleable. However, “*(g)iven the lack of clarity and general formulations, The Salamanca Statement risks serving as a foundation from which policy-makers (and researchers) can select in order to legitimize definitions of inclusion that may not be very inclusive for pupils*” (Magnússon, 2019, 686).

Inclusion in a Swedish policy-context

Several researchers have pointed out the necessity of viewing international education policies, such as inclusive education, as something that enters into an existing policy-context, with national and regional traditions, cultures, and prioritizations (Ball, 1998; Slee, 2011). The following summary, attempts such contextualization.

There has been a long tradition of emphasis on equal access, equity and equality in the Swedish education system (Lundahl, 2005; Arnesen and Lundahl, 2006), and Sweden has long been internationally renowned for having an inclusive and equitable education system. However, developments in the past 30 years indicate that this reputation is based upon old merits, and that the education system is in fact decreasingly inclusive and increasingly segregated (OECD, 2015). In fact, education reforms and policies of the past three decades have emphasized individualization, efficiency, fiscal cuts, liberal notions of equality and inclusion, and increased social segregation (Arnesen and Lundahl, 2006; Blossing et al., 2014; Dahlstedt and Fejes, 2018; Dovemark et al., 2018). Several researchers have also pointed to increased social segregation as a result of school-choice and decentralization in Sweden. Schools are becoming more homogenous in terms of pupils’ socio-economic background, ethnicity, and gender, as well as increased disparities in attainment and educational resources (Andersson et al., 2012; Bunar, 2010; Fjellman, 2019; Trumberg, 2011). Recent studies have also showed increased levels of segregation of pupils in need of special support (Magnússon, 2015, 2020, Ramberg, 2015; Tah, 2019). This appears in several manners. First of all, independent schools can legally deny admission to pupils in need of support for economic or organizational reasons. According to Magnússon (2015), approximately 15% of all independent primary

schools had done so, although the numbers varied between different profiles and ranged to over 40% among certain school-profiles. Also, there was apparent clustering of pupils in need of special support at specific types of schools and hence fewer at other types of schools (Magnússon, 2015, 2019). In addition, a parallel-market of independent schools has profiles marketed specifically toward special support has grown forth, leading to further clustering of pupils at such schools (Magnússon et al., 2014; Tah, 2019). Finally, the resources for and provision of special support (such as educated special needs teachers) varies greatly between both primary and secondary schools and has relation to whether or not the schools are publicly run or privately run (Magnússon, 2015, 2016; Ramberg, 2015).

To understand how inclusive education as an international policy affects Swedish policy, we must look at how inclusion is formulated in the legal and curricular framework of education. For instance, the word inclusion is not mentioned in any of the most important governing documents of education in Sweden, and education policies are far from clear as regards more inclusive goals of education (Göransson et al., 2011; Isaksson and Lindqvist, 2015). While conceptions of inclusive ideals of education can be found in general terms in Swedish policy (Lundahl et al., 2013), these are open for interpretation on both municipal and school level in the decentralized Swedish education system.

Isaksson and Lindqvist (2015) conducted an analysis of special education in Swedish education policy and illustrated how the conception of special education fluctuates with political and discursive societal shifts. For instance, they argue that policies emphasizing mainstreaming and integration against segregated solutions followed a general critique of the traditional special education in the 1970s and up until the 1990s. However, they argue that developments in the late 1990s led to a dislocation in education policy where increased individualist focus and new views on school difficulties arose, leading to an increased demand for medical and health-related expert-knowledge. The period between mid-2000s and 2014, was in turn marked by intense and frequent reforms of all levels of the Swedish education system. During these reforms, the idea of inclusion was openly questioned and criticized and a focus on knowledge attainment and international tests arose (Isaksson and Lindqvist, 2015).

An analysis of 23-years of Swedish government-statements (Magnússon et al., 2019) further illustrated the importance of shifts of political discourse. The “knowledge-crisis” that followed a Swedish drop in the PISA-studies was used to justify far-reaching reforms of the education system, from preschool to teacher-training, and the notion of knowledge-crisis was inherited by succeeding governments. While right-wing governments emphasized quality, choice and “better teachers”, left-wing governments tended to emphasize equality and more teachers (or more adults). Inclusion was never mentioned in any of the analyzed statements. When special education was mentioned, it was discussed as a matter of increasing teacher-competence and to accommodate disadvantaged pupils in the system. Magnússon et al. (2019) argued that as policy, inclusion is a moving and developing field and subject to political shifts on national and local levels. Thus, inclusion “competes with other political ambitions and ideals as regards education, and as our analysis illustrates, other ambitions tend to be prioritized on the political agenda” (Magnússon et al., 2019).

Finally, increased segregation in the education system is a matter of concern, whatever definition of inclusion is preferred. That leads to another analysis of inclusive education and the marketization of the Swedish education system (Magnússon, 2020). Here, all articles from Sweden that reported empirical research about either marketization in general or school-choice in particular and special education or inclusive education were analyzed. The marketization of the Swedish education system has been described as a paradigm shift in Swedish education politics (Englund, 1998; Daun, 2003) and as mentioned above, the correlation between the increased segregation and decreased equity in the system on the one hand and the rise of school-choice and market policies on the other hand is well established. As mentioned above, this increased segregation regards both pupils’ socioeconomic and ethnic background, gender, need of support, pupil attainment and the availability of pedagogical resources (staff and learning materials). As Magnússon (2020, 28–29) explains: “This relates to special education, as attainment is central to the definition of the need for special educational support in Sweden.” And that “Similar to international patterns, pupils with lower socio-economic background and with migrant-backgrounds are overrepresented among SEN-pupils in Sweden (...) groups that exercise choice to a lower degree.”

The article concludes that increased segregation of the system affects inclusion in several ways; in particular, the clustering of pupils in need of support at specific schools, their corresponding absence from other schools, and the growing market of independent special schools. Marketization has not led to innovative ways of organizing special support more inclusively, rather traditional organization of special education is reproduced and strengthened in the system and the choices for pupils in need of support are limited. Independent schools also recruit special education teachers and special pedagogues to a much lower degree than municipal schools do (Magnússon et al., 2018; Ramberg, 2015). For an education system often renowned for its inclusivity and equity, these results are dire.

As Magnússon and Pettersson (2021) argue, this illustrates a shift where traditional educational ideals have been given new meanings, including how the public and private are conceptualized. The reproduction and strengthening of traditional special education can therefore also be understood as a consequence of the emphasis of individual choice, attainment and efficiency in an increasingly marketized system as the responsibility for education is privatized to individual or family-preferences. When pupils choose segregated provision of education, it is legitimized as a matter of supply-and-demand rather than as an indicator of the need for development of more inclusive educational environments. Hence the market supplies what Norwich (2000) termed as “elective inclusion/exclusion”. In other words, pupils and parents are given the power to opt out of “inclusive” educational environments.

Inclusion in Swedish teacher-training

The importance of teacher competence to accommodate an increasingly diverse pupil-population is a common theme in education politics, and thus the importance of teacher-training is an important matter, in particular in light of the Swedish “knowledge-crisis”.

In Sweden, teacher-training is a matter of constant debate (Edling and Liljestrand, 2019; Rytzler and Magnússon, 2020) and has been reformed several times during the last 30 years (Hallsén, 2013). As Hallsén (2013) points out, teacher-training reforms are often intended to deliver teachers the system needs to fulfill its expectations, or to contribute to the development of the system rather than to organize training of autonomous professionals prepared to utilize professional knowledge, competence and discretion.

The common denominator for primary and upper-secondary levels and teacher-training is the idea that schools are supposed to shape future citizens (Popkewitz, 2009). Hence, there are concerns that teacher students are not prepared for the task after graduation, and a skepticism toward teacher educators and educational research (Labaree, 2004). This can also be understood as educationalization of social problems, i.e., education is intended to solve both current and future societal problems (Smeyers and Depaepe, 2008; Popkewitz, 2008).

Here inclusion as policy is viewed as an attempt to address present economic and social problems. Thus, aside from preparing teachers to disseminate important knowledge to the next generation, teacher-training must also prepare accountable, efficient and independent teachers (Mølsted and Prøitz, 2019) to deal with and prevent future social problems. It therefore is important to study how teacher-training organizes inclusion. Miškolci et al. (2020) argue that universities have three options for organizing inclusion in teacher-training:

- (1) to incorporate the topic into all or several courses;
- (2) to have a particular course focusing on inclusion (or special education), or
- (3) a combination of the two approaches.

This varies between different universities in Sweden, but inclusion is commonly connected to special education, no matter which approach is used. Thus, inclusive education will often be a subject in a course or lectures on special education, rather than within for instance courses or lectures on teaching or the organization of schooling. This has not been a matter of much research in the Swedish context, but a recent study (Miškolci et al., 2020) made a case study of a Swedish university. Key-actors among both teaching and administrative staff, and students from all teacher-training programs—preschool, primary school and upper-secondary school—were interviewed.

According to the respondents, the university approached the concept of inclusion and education of diverse pupil groups purposefully, both by infusing it through different courses and through a specific course on special education. However, the respondents identified a need for more on inclusion, especially its implications for teaching practices and to understand the relationship between special education and inclusion, and between disability/learning difficulties and diversity in general. In particular, students seemed to view special education and inclusive education as mutually complementary in an uncritical manner. The study concluded that a recent education reform, which called for more special education in teacher-training, had created a hierarchy between inclusive education and special education, prioritizing the latter. Rather than challenging this hierarchy, the studied university had developed and incorporated special education courses in their teacher-training programs. As teacher-training is a space in which the future school is hierarchized and shaped, this acceptance of political influence over course-structure and syllabi is revealing as regards the de-prioritization of inclusive education and the tension among these contradictory educational policies risks constraining the university's capacity to prepare its teacher candidates to develop inclusive practices (Miškolci et al., 2020).

Inclusion as an organizational question

Existing comparative studies of how municipalities and private principal organizers interpret and enact Swedish policies regarding inclusion are unfortunately based upon relatively old data. However, some general indicators can be gleaned from them. First of all, the number of pupils receiving special support in Sweden has historically been high. Giota and Lundborg (2007) estimated that approximately 40% of pupils had received special support at some time during their compulsory school education, and figures indicated approximately 20% of compulsory school pupils are seen as being in need of support at any specific time (Giota and Lundborg, 2007; Nilholm et al., 2007). Until 2014, 14% of pupils in primary schools had intervention plans for special support (Swedish National Agency of Education, 2013), but following a legislative alteration in 2014, that number had dropped to 5% in 2018/2019 (Swedish Government Official Reports 2020:42, 2020) and teachers were intended to adapt more of their teaching without documentation. Segregating measures have been deemed to be on the increase over a long period (Heimdahl Mattson, 2006; Giota and Lundborg, 2007; Nilholm et al., 2007; Emanuelsson and Persson, 2002; Emanuelsson et al., 2002; Magnússon, 2015).

Results from Giota and Emanuelsson's (2011) showed that 25% of principals in independent schools claimed that fiscal resources for special support were insufficient, and Magnússon (2016) argued that the different models of financing special support in the Swedish system was a problem for the equity of the system often raised by independent schools. Comparisons of municipal and independent schools indicate that proportions of pupils in need of special support are higher in municipal schools than in independent schools and that independent schools use segregated groups to a higher degree (Magnússon, 2015, 2020; Ramberg, 2015). There has also been a general tendency to attribute school problems to pupils and pupils in need of special support in all types of schools. Thereby, risk is further marginalized through segregation as an organizational solution (Nilholm et al., 2007; Giota and Emanuelsson, 2011; Magnússon, 2015). Schools with a particular focus on special support are becoming more common and receive increased legitimacy through parental choice (Swedish National Agency for Education, 2014). These schools claim to take care of pupils whom "the regular school" has failed, pupils who have thus "opted out" (Magnússon, 2015, 2016). This is yet another indicator of increased segregation at the system level (Giota and Emanuelsson, 2011)—in this case, based on the need

for special support. An additional risk is that special educational competence may become concentrated at special schools and that other schools may either not be able (or willing) to attain, retain, and develop appropriate competence.

In the light of recent fiscal austerity, there are increasing worries about the economic stability of the education system, particularly as regards consequences for equity. These concerns can be seen among both local politicians and principals who are economically responsible for the schools (Swedish Government Official Reports 2017: 35, 2017; Lärarnas, 2019; Plesner and Larsson, 2019). The consequences of austerity are larger classes, fewer and less qualified teachers, and teaching materials of diminishing quality. This along with recent political moves questioning inclusion as a goal for education (Swedish Government Official Reports 2020:42, 2020) indicates that inclusion has a double function on this level. On the one hand, it is a policy that is to a large degree up to the principal organizers and municipalities to interpret and enact in their organizations. In the decentralized Swedish education system, that means that several different approaches exist simultaneously, not always fulfilling the legislative demands (Swedish School Inspectorate, 2014, 2016). On the other hand, it is used as a term for the placement of pupils in regular classes and thus as justification for downscaling support services. Hence, inclusion at best becomes a secondary objective or, at worst, a justification for fiscal austerity, far departed from its original political intent.

Inclusion in practice of different professions

Schools can be viewed as complex social systems in their own right, constantly being negotiated and reorganized by the people who work and live within them—from principals, teachers, assistants, kitchen staff, leisure-time leaders, janitors, counsellors, to parents, pupils and external staff. The involvement of all occupational groups and the importance of school leadership has long been emphasized in research on inclusion (e.g., Topping and Maloney, 2005), but here I will focus on principals, teachers, and special educators.

The importance of school leadership for the quality of schooling is well established, both regarding learning, organization and development of inclusion (Leithwood et al., 2008; Seashore Louis, 2015; Hoppey and McLeskey, 2013; Persson and Persson, 2012), in particular with regard to sustainability of organizational development. Swedish principals have a legal responsibility for the organization and implementation of special support, health promotion and preventive measures (Swedish Code of Statutes 2010: 800). Thus, the development of an inclusive school environment is to a high degree the principals' responsibility. It is therefore of concern in the Swedish context that 60% of principals have left their position within 3 years, and 80% have done so within 5 years (Swedish National Agency for Education, 2020). Many principals find that they are limited in their leadership by certain policies (Lindqvist and Nilholm, 2013) and that they lack authority in economic issues and personnel decisions (Nihlfors and Johansson, 2013). In a more recent study, Magnússon and Pettersson (2021) reported results from interviews with 22 head teachers of primary schools about inclusion and the market. Most of the principals defined inclusion in terms of goal attainment and "reaching one's full potential", a clear market-influenced formulation with focus on the individual, while others focused more on the societal role of schools, and as a matter of community at the school. The definition of *who* was to be included varied as well, from a broad socially-oriented definition focusing on accommodating newly-arrived refugees and integrating different cultures and religions to a focus on pupils requiring special educational support. An in-common reasoning was that inclusion should not revolve too much around pupil-placement as separating pupils into segregated teaching environments was seen as conducive to their knowledge-attainment; that is, a view of participation in special groups as a manner of organizing inclusion. When it came to the influence of the market on inclusion some principals proclaimed that the idea of inclusion had been ruined by school-choice due to the segregating consequences of the market. Others viewed successful inclusion in their schools, as a tool for competing in the market. In the second case, it can be argued that inclusion is seen more as means to an end, rather than an end in-and-of-itself. Inclusion was in other words a matter of reputation rather than pedagogical objective.

There are several differences in how different professions define and explain special support (Lindqvist et al., 2011; Lindqvist, 2013a). Some prior research indicates that school difficulties are often explained in terms of the pupils' individual attributes rather than organizational factors by principals and teachers, with the exception of the special educators (Lindqvist, 2013a,b; Nilholm et al., 2013; Magnússon and Göransson, 2019). In fact, the differences are so great that Lindqvist et al. (2011) indicate that different professions have different agendas for special support and inclusion. Special educators tend to express values and opinions in line with a more inclusive perspective (Lindqvist et al., 2011; Lindqvist, 2013a; Nilholm et al., 2013; Göransson et al., 2015). This has led to a general view of special educators as being more inclusive and having similar views, but Göransson et al. (2019) showed that despite this there are several differences within the group.

While the special educators are often seen as important for the development of inclusive education, their role is not defined in the Swedish Education Act, and no demands are made for them to be employed by schools. This has also led to common misunderstandings among school staff regarding their role (Magnússon and Göransson, 2019) and, it seems that special educators shape and adapt their occupational roles to the demands of the school they work at (Göransson et al., 2015; Klang et al., 2017). Given that both principals and teachers tend to be less positive toward inclusion and more in favor of traditional special education, special educators are likely to be working in organizational frameworks they do not deem appropriate (Lindqvist, 2013b; Göransson et al., 2015). Here it is also of relevance to remember that Swedish independent schools employ special educators, the professions most inclined to inclusive values, to a much lower extent than municipal schools in Sweden (Magnússon et al., 2018; Ramberg, 2015). This is likely both because special educators have higher salaries and are therefore an expensive resource for schools, and because they come from the pool of experienced teachers, and Sweden has been experiencing an increasing shortage of certified teachers. Of course, this affects the pupil/teacher ratio, which leads to larger classes and work that is more intensive for individual

teachers. Independent schools also tend to have a lower proportion of certified teachers (OECD, 2015; Swedish National Agency for Education, 2019). The decline has been explained with increased bureaucratization and distrust in the professional competence of teachers (OECD, 2015), and has also been related to the marketization of education, which increases dimensions of customer-service and a standardized, goal and results-driven enterprise in the work of teachers (Beach et al., 2014; Nilsson-Lindström and Beach, 2015).

To summarize, teachers and principals tend to be less enthusiastic toward inclusive education than special educators are. There is also increased stress within the system, particularly in the retention of principals; those who are legally accountable for inclusive organization, and teachers, who are to adapt their teaching to increasingly diverse pupil groups in ever-larger classes with limited support. Special educators, who are generally positive toward inclusion, are a scarce resource within the system, and practically non-existent at certain schools. These stressors are detrimental to the development of inclusive education at school level. There are significant differences between schools with respect to inclusive education in the decreasingly equitable Swedish education system.

Concluding remarks

The aim of this article was to illustrate the complexities of inclusive education as a policy that travels from an international arena to the level of practice in local schools, using Sweden as an example. I've summarized some of the ambiguities in the original formulations of inclusive education in the Salamanca Statement (UNESCO, 1994), and argued that these allow for different interpretations of what is considered inclusive in different contexts. More importantly, I've shown how national Swedish education politics have shifted in the past three decades, from equity and inclusion as a national priority toward a more individualized and marketized system, characterized by increasing inequity and social segregation, negatively affecting disadvantaged pupil groups. In the years since the Salamanca Statement (1994), inclusion has not been a prioritized policy in Sweden, it is not even explicitly mentioned in political statements or primary education policies or legislation. The prevalence of segregating methods and organizational solutions is common and increasing among both municipal and private principal organizers. Recent political signals from the government also undercut inclusion as a political ambition. Finally, both principals and teachers are experiencing increased stress as a result of both external demands, fiscal austerity, and the questioning of their professional autonomy—this is visible through high turnover and a deficit of certified teachers. Additionally, the occupational groups most inclined to inclusive values are scarce, often misunderstood, and often working in organizations that do not prioritize inclusion. The prerequisites for inclusive education on all levels in Sweden are therefore deficient and there are no signals of a political will to emphasize inclusive ambitions.

While this image is bleak, the primary contribution of this article is threefold. First, it utilizes an analytical approach that can be adapted and developed further to illustrate the nuance and interplay between international policies and national and local prerequisites for education practice in line with these policies in general and as regards inclusion in particular. Second, it illustrates the importance of contextualization of education policies in general, and inclusive education in particular at national and local levels. Further and more nuanced analyses of how these policies are enacted are needed however, but here the prerequisites are made visible. Finally, by showing both ambiguities of policies, and the contextualization of these throughout complex education systems, we can identify challenges to the radical political potential of inclusive education in policy and practice and attempt to address them. A good starting-point would be the material prerequisites provided to develop inclusion. Without provision of resources, policies may lead to the antithesis of inclusion. Another would be to request that policy-makers and practitioners be more explicit with their ambitions as regards inclusion. Finally, more attention needs to be directed to the development of inclusive practices and organization.

Acknowledgments

The writing of this article was to a great extent the result of a one-year research-position I received at the Department of Education, Uppsala University, which alleviated me from my everyday-duties at the university during most of the otherwise tumultuous year of 2020. I'd like to thank the Department of Education for this opportunity. I'd also like to thank the research-groups that I belong to at Uppsala University (PS and STEP) for lively and challenging discussions, which have contributed greatly to the development of the argument presented here.

Introduction

This chapter focuses on the innovations in legislation and policy in Portugal in the context of developing an inclusive education system. In his analysis of cultural reproduction and distribution of power, Bernstein claims that "... curriculum, pedagogic practice, and modes of evaluation set the terms for the crucial encounters in the classroom context of teachers and pupils" (Bernstein, 2003, p. 154). However, Lingard and Mills consider that "... of the three message systems of schooling, sometimes the main driver is assessment or its narrower companion, testing" (Lingard and Mills, 2007, p. 237). So, in this chapter, we will review the development of policies of inclusion and assessment in Portugal. Building on Bernstein's idea of the three message systems of schooling: curriculum, pedagogy, assessment (Lingard and Mills, 2007), we argue that any country's attempt to develop an inclusive education system must consider and align both curriculum and pedagogical issues. Pedagogical issues (understood as comprising issues related to teaching, learning, and assessment) should be focal in processes and discussions about developing inclusion in education for all learners. However, changes to pedagogical approaches in education are slower and more complex than changes to the curriculum, as they require a consistent policy approach that involves long-term teacher education and empowerment.

The *Education for All* and the inclusive education movements have different origins (Miles and Singal, 2010; Kiuppis, 2014) with different groups of learners being its initial focus or "raison d'être." In Portugal in the 1950s and 1960s there were extremely low levels of literacy and access to education (10% population). Only a minority of the population attended education, and this was based on a very selective system in which exams played a key role in the (non-) transition between cycles and in grade repetition (Fernandes, 2014). The mid-70s brought an awareness of the selective and discriminatory character of education, and a move away from national exams. It also brought an inflow of migrants from the Portuguese former colonies (Marques et al., 2007), which caused a diversification in the school population from the 1980s. The publication, in 1986, of the Fundamental Law of the Education System (Law 46/86 of 14 October), approved after a wide public debate and a meaningful political consensus, is a crucial landmark of the development of the Portuguese public policies in education. The structure of the Portuguese educational system set out by this law is organized into Pre-School, Basic and Secondary Education. Basic education comprises three cycles: First Cycle (Grades 1–4); Second Cycle (Grades 5–6), and Third Cycle (Grades 7–9). Secondary Education includes Grades 10–12.

The parallel development of education for all and inclusive education described by Kiuppis (2014) can be observed in the Portuguese context. As described above, through an opening of education to children and young people from lower social economic backgrounds (aiming to achieve education for all), and a parallel development of legislation from the late 1970s that expected the increasing presence of some learners with disabilities in mainstream schools (special/inclusive education movement). We argue here, and in line with recent international policies (e.g., United Nations, 2016; International Bureau of Education-UNESCO, 2016; UNESCO, 2017), that inclusion in education means much more than mainstreaming learners with disabilities—that it means changing education systems to remove barriers to learning that may be experienced by all learners.

What do we mean by inclusion in education?

According to the General Comment 4 on Article 24 (United Nations, 2016), inclusive education is to be understood as a fundamental human right for all learners which requires a whole system and whole person approach. This approach requires changes to institutional cultures, policies, practices—including flexible curricula and pedagogies. At the basis of the development of inclusive education is support being available not only to learners, but also to teachers.

Inclusion involves a process of systemic reform embodying changes and modifications in content, teaching methods, approaches, structures and strategies in education to overcome barriers with a vision serving to provide all learners of the relevant age range with an equitable and participatory learning experience and environment that best corresponds to their requirements and preferences.

United Nations (2016, p. 4).

We consider that an inclusive education system is one in which all learners have access to, participate, and succeed in education. As these three concepts can be used in different ways, we will start by defining what we mean by access, participation, and success as shown in Fig. 1.

Access means both physical access to school buildings and to learning and teaching—accessible to all learners, regardless of their abilities or backgrounds. For example, braille or enlarged print might make learning accessible to learners with vision impairments, or interpreters may facilitate learning for learners from diverse linguistic backgrounds.

Participation means taking part in the activities, but also feeling part of a group, a class or a school—a sense of belonging as proposed by Slee (2019). Since the sense of participation is individual and subjective, different learners might feel included or excluded by the same activity or situation. Participation could be seen as a “core element and, at the same time, a lever for the improvement of inclusion” (Susinos, 2020, p. 201).

Success cannot be reduced to the enrollment of learners with disabilities in a mainstream school. Inclusive education means accepting the principle that all learners can learn and be taught, therefore, teachers should hold high expectations for all learners (Hart et al., 2004). Success in education tends to be determined by assessments, particularly by summative assessments and grades. On the other hand, systematic formative assessment, sometimes referred to as assessment for learning, has been related to significant improvement in student learning, and learners who are considered to “have more difficulties” are the ones who benefit the most from consistent formative assessment (Black and Wiliam, 1998). Thus, assessment can be looked at as a powerful pedagogical process in the path to developing inclusive education. When referring to assessment and success, the latter should consider the best interest of each learner as proposed in the UN Convention on the Rights of the Child (United Nations, 1989). Understanding what success means for different learners requires considering the aims of education in general, and should start from an understanding that learners’ learning and life opportunities improvement need to take into account all forms of personal, social, and academic learning (European Agency for Special Needs and Inclusive Education, 2017). Success needs to be considered in the context of providing equitable, quality education to all learners (United Nations, 2015).

Fig. 1 Access, participation, and success as the main pillars of inclusive education.

What do we mean by assessment?

Learning assessment is generally conceived as a process that enables teachers to gather relevant information about what learners know and can do, to make a variety of possible decisions (e.g., Black and Wiliam, 1998; Assessment Reform Group, 2002). This can be achieved through external and internal assessments. The former ones are generally administered and run by some sort of entity external to the schools (e.g., Ministry of Education, Assessment Institute) whereas teachers and schools are fully responsible for internal assessments.

For the purposes of this chapter, pedagogical assessment is seen as a process through which both teachers and learners might collect, analyze, interpret, discuss, and make use of information related to learning taking into account a variety of purposes such as: (a) to provide quality feedback on learner’s work to both learners and parents; (b) to track the learning progress toward what has been defined through a given set of criteria, indicators and standards; (c) to identify those aspects of learning that need improvement as well as those that show a good domain of the material to be learned; and (d) to determine learners’ grades (Fernandes, 2019). Some of these purposes are formative by nature, that is, they are aimed at supporting learners’ efforts to learn through the distribution of quality feedback. Therefore, feedback is intrinsically associated with formative assessment and in a very systematic way it must make learners aware of what they are supposed to learn, where they are in the process of learning, and what they should do to achieve the intended learning outcomes. In a sense, formative assessment is day-by-day assessment integrated in teaching and learning and, therefore, it is pedagogical by nature because it has to do with the use of a variety of teaching and assessment methods that help learners to succeed. In this context, teachers’ questioning of learners becomes critical. And the, information that results from formative assessments should never be used to grade learners. Other purposes are of a summative nature, that is, at

a certain point in time they make a synthesis of what learners know and can do. This is, for example, the case of grading a particular piece of learners' work (e.g., essay, test, oral report, portfolio of artifacts) or grading learners' work at the end of a given period like a semester. However, summative assessments can also be used for the single purpose of providing feedback to learners; and this means that the results of these assessments are not used to grade learners.

Pedagogical assessments are internal by nature and their fundamental purpose is to improve learners' progress. Even grades should be thought as a means to help learners to progress. Particularly if some form of feedback is attached to them.

In sum, pedagogical assessment encompasses both formative and summative assessments. Research has been showing that formative assessment, also labeled as assessment for learning, increases dramatically what learners learn (Black and Wiliam, 1998) due to the effect of quality feedback. Summative assessment, also known as assessment of learning, can be used to provide feedback, to grade learners' work or to do both. Formative assessment is continuous because it is integral to teaching and learning and, as a result, it regulates these pedagogical processes through feedback. Summative assessment is periodical by nature since it is used to provide an overview of learners' learning at certain points in time. One of the goals of assessment might be the achievement of learners' continuous self-assessment of their own learning and productivity.

Development of inclusive education policies

This section provides a brief overview of the development of legislation and policies focusing on special/inclusive education in Portugal. The national legislation changes have been taking place roughly every decade since the 1970s (1979, 1986, 1991, 2008, 2018) pursuant to developing an inclusive school where all learners are welcome and supported in their learning. Further details on the progress toward inclusion can be found in recent publications (cf. Alves, 2019; Alves et al., 2020; Alves, 2020).

The Law on Special Education of 1979 (Law 66/79) created the expectation of some learners "with disabilities" to attend mainstream schools and it was anticipated that schools would progressively adapt and restructure to respond to the needs of learners with sensory, physical and intellectual disabilities. The expectation was not that all learners would attend mainstream schools, and so segregated settings were created as a result of parent and social society movements. These consisted mainly of education and rehabilitation cooperatives (CERCI—Cooperativas de Educação e Reabilitação de Crianças Inadaptadas), which still exist at present. Its role has developed from responding only to the needs of children with learning disabilities in schooling age, to its present form which includes for example Early Intervention Units, Vocational Education and Training Centers, Protected Employment Centers, and home support for disabled people in general.

The 1986 Fundamental Law of Education (Law 48/1986) is to this day, the structuring legislation which presented the blueprint of the Portuguese national educational system, recognizing the right to education for all; aiming to offer equal opportunities. This legislation extended compulsory schooling to nine years or until learners reached 15 years old. Compulsory schooling was increased to 12 years in 2009 (Law 85/2009). Law 48/86 proposed that learners would attend either special or mainstream schools depending on the level of "specific education need." This legislation considered special and mainstream schools to be part of "mainstream education."

The 1991 legislation established the special education system for learners "with special educational needs" (Decree-Law 319/91). This legislation aimed to develop "schools for all," and it increased the responsibility of mainstream schools "for the problems of learners with disabilities or learning difficulties" who should attend school in "the least restrictive environment." Additionally, it introduced the concept of "special educational needs" based on pedagogical criteria to substitute "the category-based classification, based on medical decisions." This legislation considered "special education" a pedagogical response to strengthen the individual autonomy of learners with physical and mental impairments.

In 2008 the legislation outlined specialized support for learners' special educational needs (Decree-Law 3/2008, Ministério da Educação, 2008). It aimed to further develop a "democratic and inclusive school, targeting the success of all children and young people," and defended a "flexible education system" to "guarantee equality in the access and in the results." Mainstream schools were expected to accept all learners. However, this legislation created a strong divide between learners "with Special Education Needs" and learners who could experience difficulties due to reasons that fell out with the "Special Education Needs" criteria. Using the language proposed by the International Classification of Functioning, Disability and Health (WHO, 2001) the policy defined "SEN learners" as those who needed specialized support provided due to "significant limitations at the level of activities and participation due to permanent functioning and structural alterations." Individualization and personalization were pedagogical approaches proposed to develop universal competencies and citizenship for all, as opposed to specialized support to promote the "biopsychosocial functioning" of a minority of learners "with SEN."

The 2018 changes to policy included a new legal framework for inclusive education (Decree-Law 54/2018, Ministério da Educação, 2018a). Using the terminology in this legislation, it aims to develop a second-generation inclusive school, where all learners have their potential, expectations and needs met, regardless of their personal and/or social situation. This new framework claimed to reject the need to categorize learners in order to provide the necessary educational responses. Instead, it proposed a tiered approach to support learning and inclusion, organized into: universal, selective and additional responses. The universal level involved changes to teaching and learning methods, resources, and assessment—it can include interventions targeting academic aspects or behavior. The selective level involved non-significant changes to the curriculum (aims and contents), psycho-pedagogical support, prior learning, or extra support interventions, and tutoring for learners perceived to be disengaged, and struggling. The additional level involved significant curricular adaptations (e.g., different curricular content) and should be available for

learners with considerable and persistent difficulties in communication, interaction and learning with a view to develop personal and social autonomy. The additional responses include Individual Educational Programs and Individual Transition Plans, attendance “by subject,” specialized resources and teaching. The enactment of this policy relies on the work of multidisciplinary teams that include teachers, “technicians” (e.g., Speech and language therapists), parents/carers and learners. These teams are described in the legislation as a pillar to the identification of responses and monitoring of its suitability and implementation. An interesting input of this legislation to pedagogies used in school was the indication that learning, and teaching should be designed based on the principles of Universal Design for Learning.

This wave of policy changes also brought other associated legislation which related to creating a more inclusive education system. One of these was the Decree-law 55/2018 ([Ministério da Educação, 2018b](#)), which established a revised curriculum and assessment principles. This legislation planned more flexibility in the way schools manage the curriculum and pedagogies. It proposed specific measures such as developing learners' citizenship and autonomy through project-based learning, diversifying work configurations, student outputs (oral, written, visual, multimodal) and an emphasis on formative assessment in order to deal with difficulties as soon as they emerge. This legislation points to another key policy—the “Learners' Profile at the end of compulsory schooling” (*Perfil dos Alunos à Saída da Escolaridade Obrigatória*) ([Ministério da Educação, 2017](#)). The “Students' Profile” conceived learning at the core of education and raised relevant issues concerning curriculum development, learner participation, and pedagogical innovation. This overarching policy is imbued with an inclusive approach, setting an expectation that learning and teaching should adapt to the individual's characteristics to create full participation, a sense of belonging, and equity in education and contribute to social inclusion and cohesion. The aim was to get all learners to reach the competencies outlined in the “Learners' Profile.” In this context, assessment for learning, that considers academic, behavioral, social, emotional and environmental factors, plays an important part.

Despite governmental changes over the years, the development of policies has steadily aligned with a vision of a mainstream school which should respond to the needs of all learners. International policies such as the United Nations Convention on the Rights of the Child ([United Nations, 1989](#)) and the Salamanca Statement (1994) have influenced and guided to some extent the route to a more inclusive education ([Alves, 2019](#)). In a context of national, centralized educational policies, the responses to some of the challenges to inclusion such as poverty, school failure, and drop out, have been tackled through projects and/or programs which encourage local solutions such as the National Program to Promote School Success (PNPSE—Programa Nacional de Promoção do Sucesso Escolar, 2016–Present), the area-based intervention “TEIP” (Territórios Educativos de Intervenção Prioritária 1996–Present), the Pedagogical Innovation Pilot Project (PPIP—Projeto-Piloto de Inovação Pedagógica, 2016–2020), and the Autonomy and Curriculum Flexibility Project (PAFC—Projeto de Autonomia e Flexibilidade Curricular, 2018–Present). Some developments concerning assessment policies in the last decades will be discussed in the following section.

Development of assessment

The Fundamental Law of the Education System (Law 46/86 of 14 October) provided the country with fundamental guidelines and with an agenda for education putting an end to 12 years of a certain deregulation that followed the democratic revolution of April 25, 1974. Legislation establishing fundamental curricular principles as well as new syllabi for Pre-School and Grades 1–12 (K-12) was issued in 1989 (Decree-Law 286/89, 29 August) followed by a major experimental and phase-designed process which was put into practice in a group of pilot schools for four academic years in a row from 1989-90 to 1992-93). In 1993–1994, after an evaluation of the experimental process, the new curricula for Grades K-12 were generalized to the whole educational system. For the first time since 1974 Portugal could enjoy a more coherent, logical and consistent legislation pointing to the need to integrate curriculum, pedagogy, learning, assessment, and teaching. This is illustrated by two historical pieces of legislation on learning assessment published in 1992 and 1993 (Legal Norm 98-A/92, 19 June, for Basic Education—Grades 1–9, and Legal Norm 338/93, 21 October, for Secondary Education—Grades 10–12). In fact, in these Legal Norms the legislator stated very clearly that formative assessments should prevail in the classrooms as a means to improve both teaching and learning. Summative assessments, on the other hand, should be considered as a means to collect information at specific points in time to balance out what learners knew and were able to do. Assessments, particularly those of a formative nature, began to be considered fundamental pedagogical processes to include rather than to exclude learners.

This progressive legislation was inspired by cognitivist perspectives on assessment as well as by sociocultural visions on learning and teaching emerging in the 90s ([Cardinet, 1991](#); [Berlak et al., 1992](#); [Gifford and O'Connor, 1992](#)). However, cultural, and pedagogical traditions, ancestral teaching practices and, above all, a generalized conception of assessment as a measure or as means to assign grades, soon revealed that teachers and schools needed to be supported in order to use assessments as pedagogical processes aimed at improving learners' learning and matching the legislation guidelines.

In both Legal Norms 98-A/92 and 338/93 external learning assessments, that is, assessments that were developed by some entity external to teachers and schools, were also regulated. The former established external assessments—*Provas Aferidas* (National Low Stakes Tests)—aimed at regulating the educational system as a whole and without any sort of influence in learners' ratings and academic progress. These assessments were designed for basic education learners (Grades 4, 6, and 9) and began to be administered in the Mathematics and Portuguese subjects only in the year 2000. The process of these assessments was never clear enough and had been an object of constant changes, concerning issues such as its nature, purposes, utilization, and population coverage. Quite recently, through Decree-Law 17/2016, these, and other issues of National Low Stakes Tests were clarified. Currently they are

criteria-based assessments and a means to provide learners and teachers with data aimed at helping them to improve their learning and teaching processes, respectively. Thus, they are external summative assessments that are being used in a formative way. As a consequence, they are more aligned with the idea of inclusion than its former counterparts that were created more than 20 years ago. Moreover, these are no longer assessments in Portuguese and Mathematics only. In order to avoid the so-called effect of curriculum narrowing, these assessments are now tackling all curriculum subjects from Mathematics and Portuguese to Social Sciences, Arts and Physical Education. Finally, rather than being administered at the final year of each cycle of basic education (Grades 4, 6, and 9) and in order to be consistent with the idea of its formative utilization, they are administered at toward the start or mid-cycles, at the end of Grades 2, 5, and 8.

These external, criteria-based assessments, aimed at providing learners, teachers, parents, and schools with feedback on learners' learning are more consistent with pedagogical assessments, as defined above. Therefore, it seems that there is now a new generation of external assessments in Portugal that could contribute to improve teaching and learning, to diminish inequalities, and to contribute to a more inclusive and democratic education. Nevertheless, in 2002 in the context of Basic Education, National Examinations were introduced in Portuguese and Mathematics at the end of Grade 9 (Decree Law 209/2002, 17 October). These examinations are still part of the current overall assessment architecture, but they might be considered as "low" or even "very low stakes" since their results only represent 30% of the determination of a student's final grade whereas the weight of internal assessments, a teachers' exclusive responsibility, is 70%.

Legal Norm 338/93 also introduced external assessments—*Exames Nacionais* (National Examinations)—at the end of secondary education. These are dual-purpose exams since they are aimed at both certifying learners' secondary education and selecting learners to access higher education. This legislation reintroduced the secondary school examinations into the system since its elimination after the April 25, 1974. These exams began in the 1995/1996 academic year and are still in use with the two above-mentioned purposes regardless of the slight adjustments that were introduced in the legislation throughout the last 25 years. Now a student must take two exams in Grade 11 and two in Grade 12. For the purposes of secondary school graduation these exams are low or even very low stakes since, as we have mentioned, they only represent 30% of the final grade which contrasts with internal assessments weighted at 70% of a student's overall grade. Typically, one or two of these examinations are specific to enter a given higher education course and, in this case, the student's grade to apply is computed based upon internal final grades, weighting 50% and external grades in the specific exams, also weighting 50%. Therefore, in the context of learners' access to higher education the exams are moderate stakes tests.

In recent years Portuguese public policies have been emphasizing the need to develop new and innovative curricular and pedagogical visions to build up a more democratic and inclusive educational system. As previously mentioned, in 2017, the above mentioned "learners' Profile" was issued, which is possibly one of the most comprehensive and meaningful curriculum materials ever published in the country. The document mobilizes, integrates and uses in a particularly successful way research recommendations carried out in education in the last decades. It defines *Principles* (e.g., Inclusion, Humanist Education), *Competency Areas* (Problem Solving, Esthetic and Artistic Sensitivity, Critical and Creative Thinking, Scientific, Technical, and Technological Knowledge), and *Values* (Responsibility, Citizenship, Participation). Indeed, it is a far-reaching set of guidelines for the development of the Portuguese mandatory curriculum (Grades k-12) which was the object of a wide debate in the country and eventually ratified through Legal Norm 6478/2017 ([Ministério da Educação, 2017](#)) or more if schools design a pedagogical project approved by the Ministry of Education. This document defines two important mandates to schools and school clusters. On one hand it calls for a more humanist, democratic, progressive, and inclusive education, and, on the other hand, it challenges the system to become one where learners have ample opportunities to learning to think.

The "learners' Profile" called for a consistent vision of pedagogy where issues of teaching, learning, and assessment should be integrated processes. This means that assessment rather than being essentially a means to grade learners should become a pedagogical process aiming at improving teaching and learning. Thus, formative assessment should prevail within all pedagogical actions that take place in schools and classrooms. Besides, assessments in general should be at the service of learning including summative ones. But that vision also meant that learning must be at the center of all teaching efforts and sociocultural perspectives on learning issues should be taken into account ([Lave and Wenger, 1991](#); [Wenger, 1998](#)). Consequently, in 2018, Decree-Law 55/2018 ([Ministério da Educação, 2018b](#)), provided a framework for both basic (Grades 1–9) and secondary education (Grades 10–12) curricula defining important pedagogical principles, namely on assessment organization and practice. Moreover, it created the real possibility for schools to autonomously manage up to 25% of the National curriculum ([Ministério da Educação, 2018](#)). The above discussed Decree-Law 54/2018 that defines the legal framework for inclusive education, completes a set of three important legal documents that represent the current public policies concerns to develop a more democratic and inclusive educational system.

To summarize, since 1986 the Portuguese public policies in education and, in particular, in learning assessment, seem to have evolved from a vision of assessment as grading or assessment as a measure, toward a perspective that sees assessment as a pedagogical process aimed at improving learning. Nevertheless, much still needs to be done to decrease inequalities among learners, particularly those related to their socioeconomic and cultural backgrounds which continue to have a disproportional impact on student achievement; as well as to support teachers' pedagogical practices who may face challenges regarding curricular and pedagogical innovations, inherent to the mentioned current legislation.

Assessment for inclusion or exclusion?

Until the mid 1970s there was an attempt to democratize and innovate in education, but exams remained the sole form of assessment and progression between cycles. Assessment served the purposes of grading, selecting and ranking learners (Fernandes, 2014). Exams have progressively lost their exceptional weight and, after 1974, they were practically abolished. They were reintroduced through public policies in 1993, and started being used in 1995/96 to certify secondary level learning and accessing higher education. From 2000 a number of initiatives were put in place to allow learners to develop and avoid grade repetition as the response to student difficulties (Fernandes, 2014). Nonetheless, grade repetition and early school dropout continue to be a challenge, despite consistent improvements (Conboy et al., 2013; Ferreira et al., 2015). There has been a trend of national policies, complemented by projects and/or programs that allow schools and teachers to adapt the national policies to their own contexts, at least since 1986. Those projects and/or program have been created over the years for example to try to respond to student diversity and avoid grade retention and early school dropout. Examples of these are the Inter-ministerial Program to Promote Educational Success (PIPSE, Conselho de Ministros, 1988), National Plan to Prevent School Dropout (PNAPAE, Ministério da Educação/ Ministério da Segurança Social e do Trabalho, 2004), More School Success Program (PMSE, Ministério da Educação, 2009), National Program to Promote School Success (PNPSE, Conselho de Ministros, 2016), and measures such as the Specific Tutorial Support (ATE, Gabinetes da Secretária de Estado Adjunta e da Educação e do Secretário de Estado da Educação, 2018). These initiatives were based on the presumption of schools being problem solving organizations (Skrtic, 1991) that consider uncertainty as an opportunity for innovation, based on collaboration and interdependence (Lloyd, 2000). While they can be ways to foster change toward more inclusive schools, they can give the appearance of add-on solutions to an already established system which resists change. Despite the voluntary or optional nature of these initiatives to develop inclusion and school and teacher autonomy, the adherence of schools and teachers is very substantial (e.g., Flexibility and Curricular Autonomy Project—PFAC, Project MAIA: Monitoring, Support and Research in Pedagogical Assessment). These projects help uncover differences between schools and school clusters both in terms of student population, and implementation of initiatives. While also revealing a requirement for Portuguese schools and teachers to be supported in their implementation of comprehensive visions of inclusion, which require rethinking curriculum, and pedagogy in terms of teaching, learning and assessment.

An inclusive education system, that promotes access to, participation in, and success of all learners requires a reconsideration of curriculum, and pedagogy. This reconsideration can be supported by Bourdieu's notions of capital (Bourdieu, 1986), as we should analyze which types and forms of knowledge are valued by schools. Assessment often crystalizes valued types and forms of knowledge and "assessment tools recognize the cultural practices of some while ignoring the cultural practices of others" (Kozleski and Waitoller, 2010, p. 663). The development of an inclusive school requires considerations of how assessment can become a proxy for cultural capital, and even though it is sometimes thought of as neutral, it is mediated by the assessors' biographies, and assumptions about knowledge, learning and learners (Kozleski and Waitoller, 2010). Similarly, to the existence of a national curriculum, the presence of external assessment is sometimes presented as a way to ensure more equitable education systems. However, external assessment on its own does not guarantee equity in terms of learning opportunities, it needs to be part of an overall vision and policy effort (Fernandes, 2014).

Another vulnerability and threat of external assessment to the development of inclusive schools, is the association of external assessment to notions of evaluating whether schools are effective and efficient. Lloyd (2000) considers a move away from the rhetoric of the "effective and efficient school" to a focus on developing "barrier-free, flexible, responsive, inclusive learning environments" is essential (Lloyd, 2000, p. 146). To achieve this, Lloyd suggests teachers need to be empowered and see themselves as agents of change who need themselves to work collaboratively, to adopt "... critical problem-solving approaches to practice" (Lloyd, 2000, p. 148). Since the 1990s, school-based teacher education centers (Centros de Formação de Associação de Escolas, Decree-Law 249/1992) have played a role in teacher continuous professional development. However, teacher learning for diversity (Szelei and Alves, 2018) and schools' use of assessment for learning needs to be further supported and teachers must be empowered. Teachers need the time and tools to reflect and analyze their school contexts, and to develop responses which are both consistent with research and literature recommendations and specific to their teaching and learning contexts. The implementation of collaborative action-research approaches for inclusion may demand considerable changes to the way we organize education times and spaces, and the way we comprehend relationships between teachers, and between teachers and learners. It will require valuing diversity, and questioning which types and forms of knowledge are valued—and aiming to diversify the valued knowledge. If we want to develop an inclusive education, assessment cannot be an afterthought and should not be a system on its own, it should play a part in the pedagogy message system of schooling (Lingard and Mills, 2007). Inclusion and assessment cannot be "add-on solutions" (Skrtic, 1991) in schools that resist changes, they need to be developed as a whole when planning learning and teaching.

Portugal has been a late comer to the Education for All movement, but has quickly made attempts to widen access to education for all, namely access and participation of learners with disabilities in mainstream education. Evidence suggests a continuity in Portuguese educational public policies toward equity in the past 35 years (Fernandes and Gonçalves, 2018), particularly in terms of access to education, and not as consistent in terms of success. The recent interrelated educational policies regarding curriculum, pedagogy and assessment are an important step and came to reinforce the commitment to inclusion. They provide a key pillar to avoid disjointed approaches to different learners and different "types" of diversity. The policy rhetoric of developing a truly inclusive school where all learners are welcome, are able to participate and learn, needs to be supported through flexibility for schools to adapt to their local learners and contexts, appropriate funding, and opportunities for teacher continuous professional development

(CPD). CPD should involve comprehensive in-service teacher education programs in which educators have ample opportunities to become familiar with, reflect and discuss policies, theories, research, and practices that support inclusive approaches to learning, teaching and assessment.

Introduction

Good quality education needs to be inclusive, ensuring that all learners participate in and achieve. During learning that is responsive to individual learner differences. Thus, inclusive education can act as a catalyst for change in educational practice, leading to improved learning outcomes (Ministry of Education, Science and Technology – Malawi & Save the Children. Despite having adequate legal frameworks, children from ultra-poor families, children and youth with disabilities, girls out of school (including teenage mothers), refugees and displaced children and youth, are particularly affected by exclusion and marginalization in southern Africa. Throughout the world, one billion people (15%) of the world's population, experience some form of disabling conditions, with 80% living in low income countries, southern Africa included (WHO and World Bank, 2011). Persons with disabilities, on average, are more likely to experience adverse socio-economic outcomes than persons without disabilities. Globally, people with disabilities are considered the world's largest minorities, albeit intersecting with other social categories: men and women, children, different races and cultures among all social classes; wealthy and poor, and highly educated and the illiterate (UNESCO, 2020). Historically, many children with disabilities have been excluded from basic mainstream education and access it in separate specialized schools (WHO and World Bank, 2011). This makes people with disabilities, especially children and youth, vulnerable to exclusion and stigmatization later in life.

Africa mainly comprises low-income countries where education is less likely to be obtained by children and youths with disabilities (UNESCO 2020). Over 87 million primary school-age children, secondary school-age adolescents and youth in sub-Saharan Africa, remained out of school in 2014. Member States supported by the UNESCO Regional Office for Southern Africa (ROSA) are among the poorest countries in the world with few available resources. Children and youth with disabilities face insurmountable challenges in accessing education and most importantly, accessing high-quality and equitable inclusive education (UNESCO, 2020).

Inclusive education implies increasing participation of learners in the culture, curricula and communities of their neighborhood learning centers that respond to learner differences; hence, leading to improved quality education (UNESCO, 2020). Global experience has shown that introducing inclusive practices cannot be done without introducing major system changes. The long term aim of creating a society with inclusive education, relates to the opening up of all mainstream schools and programmes so that they welcome and accommodate the learning of all members of the local community. This article draws upon inclusive education experiences from Malawi and Zimbabwe. Specifically, an analytical assessment on definitions and concepts, existing policies and strategies, practices and systems, strengths and gaps in the implementation of inclusive education in the two countries are examined. The article further offers recommendations that have implications on the provision of inclusive education in Africa.

Inclusive education in Africa

There are several regional legal frameworks in Africa. These include: the African Charter on the Rights and Welfare of the Learner (ACRWC) of 1999, which is similar to those in the Convention on the Rights of the Child, and the Southern African Development Committee (SADC) Policy Framework on Care and Support for Teaching and Learning (CSTL) of 2015. The CSTL focuses on the realization of the education rights of vulnerable learners and youth in the SADC region, by ensuring that schools are inclusive centers of learning, care and support; where every learner, especially the most vulnerable, have access to quality education. It provides a common understanding among Member States regarding the implementation of the initiative, and to guide efforts toward the realization of the CSTL goal across the SADC region.

Inclusive education in Malawi

Malawi signed and ratified international treaties and protocols relating to inclusive education, demonstrating the country's commitment to this noble cause. These include the United Nations Convention on the Rights of the Child (1989), the African Charter on the Rights and Welfare of the Child (1999), the United Nations Convention on the Rights of Persons with Disabilities (UNCRPD) (United Nations, 2006), Jomtien World Declaration on Education for All (1990), Salamanca Statement and Framework for Action, and the Dakar Education For All Framework for Action. The nation also endorsed the Sustainable Development Goals (SDGs) (United Nations, 2015), which promote access and affordable education for all boys and girls at all levels, including vocational training for vulnerable groups. This country-specific section, maps the policies, definitions and practices on inclusive education in Malawi.

The definition of inclusive education in Malawi

The concept of inclusive education is relatively new in Malawi and the country has been mainly associating it with special needs education (SNE) and students with disabilities. The recent National Strategy on Inclusive Education (NIES) 2017–21 defines inclusive education as a longer-term process of reforming the education system, cultures, policies and practices to address and respond to diverse needs of all learners (Ministry of Education Science And Technology). Inclusive education therefore is both a human rights and development issue, supporting the view that all children and young people belong together irrespective of their individual differences, based on race, gender, disability, social status, or religious beliefs (MoEST, 2017). This is consistent with Sustainable Development Goal 4 [SDG 4] (United Nations, 2015) and Article 24 of the UNCRPD (United Nations, 2006), which emphasize inclusive and equitable education.

Existing policies and strategies for inclusive education in Malawi

Malawi has shown commitment to ensure inclusive education at all levels, in line with global policies, frameworks and procedures. There are several domestic policies, strategies, plans and frameworks that have been developed and enacted by Malawi to spearhead inclusive education. These include:

- the Constitution of the Republic of Malawi (1995, as amended Act No.11 of 2010);
- the National Strategy on Inclusive Education (NIES) (2017–21),
- National Education Sector Plan (NESP) (2017–20);
- National Disability Mainstreaming Strategy and Implementation Plan (2018–23);
- Child Care, Protection and Justice Act (Act No.22 of 2010);
- The Disability Act (Act 8 of 2012), the Education Act (Act No. 21 of 2013);
- Vision 2020, Special Needs Education Implementation Guidelines (2008);
- National Education Standards-Primary and Secondary Education (2015);
- National Policy on the Equalization of Opportunities of Persons with Disabilities (2006);
- National Policy on Early Childhood Development (2017);
- National Youth Policy (2013);
- National Gender Policy (2011, Second Edition, 2015);
- National Integrated School Health and National Policy (2017);
- National School Health and Nutrition Strategic Plan (2018–22); and
- The Draft 2019–20 Multi-hazard Contingency Plan.

In responding to the challenges of SDG 4, which speaks about the aspiration to ensure inclusive and equitable quality education and promoting lifelong learning opportunities for all, Malawi developed the *National Strategy on Inclusive Education [NIES 2017–21]* (Government of Malawi MoEST, 2017). This flagship strategy aims at ensuring that all learners have equitable access to quality

education in inclusive settings at all levels of the education system in Malawi (GIZ and Government of Malawi, 2019). The strategy identified eight key areas that inform inclusive education and makes it a reality. These are:

- Capacity for inclusive education;
- Governance and Management for inclusive education;
- Learner identification and assessment;
- Inclusive Education Management Information System;
- Teacher education and motivation;
- Partnership for inclusive education;
- Enabling environment for teaching and learning; and
- Financing inclusive education.

Section 1.2.1 of the national strategy affirms that exclusion exists at all levels from early childhood development (ECD), through primary, secondary and higher education levels. Section (1.2.1) focuses on learners excluded not only from school, but also within the school, and therefore identifies a total of 20 groups of such learners. These include children with disabilities, children from ultra-poor households and marginalized girls.

The Constitution of the Republic of Malawi (1995, as amended Act No.11 of 2010) provides for the right to education for all citizens. Chapter IV, Section 20 prohibits discrimination of any form (Government of Malawi, 2010). The National Education Sector Plan (NESP) acknowledges lack of access to education among learners with disabilities at ECD, primary and secondary levels of education, non-formal education (such as adult literacy), and for out of school youths. Therefore, the NESP sets out to improve access and equity to ECD by promoting early detection, intervention and inclusion of children with specific health and educational needs, supported by inclusive curricula (JICA Malawi, 2020). The NESP further realizes the need to have targeted activities for children and adults with disabilities and provide teaching and learning materials for both in order to promote access and equity to non-formal education (JICA Malawi, 2020). The current NESP and its predecessors are widely credited to have informed the development of the five year NIES (2017–21). The NIES addresses the needs of learners with disabilities at all levels of the education system in a more comprehensive manner, to ensure quality inclusive education.

The National Disability Mainstreaming Strategy and Implementation Plan (2018–23) identifies ‘Access to Education’ for learners with disabilities as its Priority 2 area, under Section 5.2.2 (Ministry of Gender, Children, Disability and Social Welfare [MoGCDSW], 2018). This implies that the National Disability Mainstream Strategy and Implementation Plan have prioritized access to inclusive and equitable education in order to break barriers that restrict learners with disabilities from accessing their right to education.

The Child Care, Protection and Justice Act (Act No.22 of 2010) makes provision for childcare, protection, child justice; and for matters of social development of the child and related matters. The *Malawian Education Act No. 21 of 2013* stipulates that education should be for all people irrespective of any discriminatory characteristics such as race, disability, ethnicity or gender (Government Printers, 2013). It strives for accessible, equitable, relevant and inclusive education. *Vision 2020* represents Malawi’s long term development strategy. Chapter 7, Section 7.2.2 of *Vision (2020)*, makes provision for the inclusion of learners with disabilities at all levels of education (Government of Malawi, 2020). It sets strategic options with regards to the improvement of SNE and thus ensures appropriate designs to cater for people with disabilities. The *SNE Implementation Guidelines of 2008* recognizes education as a basic human right. It focuses on eight priority areas:

- early identification,
- assessment and intervention,
- advocacy,
- care and support,
- management,
- planning and financing,
- access,
- quality, equity and relevance (Itimu-Phiri and Kopetz, 2008).

The *National Education Standards-Primary and Secondary Education of 2015* policy specifies expected outcomes for learners to be delivered by all education providers in public and private institutions (MoEST-Directorate of Inspection and Advisory Services, 2015).

The National Policy on the Equalization of Opportunities of Persons with Disabilities of 2006 supports and encourages inclusive education, provision of assistive technology, adaptation of communication systems, training of specialist teachers, and inclusion of special needs education (now inclusive education) in teacher training curriculum and establishment of accessible resource rooms in schools (Ministry of Persons with Disabilities and the Elderly).

The National Policy on Early Childhood Development of 2017 has a number of guiding principles, one of which is that; “No child shall be discriminated against, on the basis of age, sex, race, health status, economics, religious or political affiliation in the provision of ECD services by any organization” (Government of Malawi, 2017). This implies that no child should be left behind when it comes to accessing education. *The National Youth Policy of 2013* provides interventions for both in-school and out-of-school youth, regardless of their circumstances.

The National Gender Policy of 2011 (revised in 2015), seeks to mainstream gender issues in the national development process to enhance participation of boys and girls, women and men for the attainment of sustainable and equitable development (Malawi National Gender Policy (2011, Second Edition, 2015).

The National School Health and Nutrition Strategic Plan (2018–22) sets out the implementation of the 2017 National Integrated School Health and National Policy. The plan supports marginalized children in school with regard to their health and nutrition (MoEST, 2018).

The Draft 2019–20 Multi-hazard Contingency Plan was crafted under the Department of Disasters Management Affairs (DoDMA) of Malawi. The plan has the Education Cluster in Section 3.3 to ensure the provision of education in emergencies, with stakeholders involved including MoEST, UNICEF, ActionAid, Save the Children, Civil Society Education Coalition (CSEC), World Vision and Mary's Meals responsible for this cluster.

These policy documents are governing inclusive education in Malawi, with the view of '*not leaving anyone behind*' in accessing education. The next section focuses on practices, systems and structures of inclusive education in Malawi.

Practices, systems and structures of inclusive education in Malawi

Inclusive education in Malawi is implemented at all levels, from national level down to the school level. At school level, there are SNE teachers and itinerant teachers, who teach learners in resources units and/or special classes (MoEST, 2016). Other learners with disabilities are taught in mainstream classes, depending on the extent of their impairments. The itinerant teaching program was started by the MoEST in collaboration with Sightsavers, which is an international non-governmental organisation, whose headquarters are in the United Kingdom. Sightsavers works in more than 30 countries to prevent avoidable blindness and fight for the rights of people with disabilities.

With the itinerant teaching program, specialist teachers provide basic training to teachers in mainstream schools on how to improve inclusion in the classroom (Banks and Zuurmond, 2015). Also, itinerant teachers provide some direct support to children with profound visual impairments in mainstream schools within their catchment area (Research for Inclusive Education in International Cooperation, 2015). At district level, the SNE coordinator uses tools and procedures that are not available in all districts in Malawi. Each coordinator has self-defined assessment tools and procedures, which s/he shares with specialist and itinerant teachers within the district. The SNE coordinator does not directly work together with the health personnel and social welfare officer to develop and conduct district level assessment and procedures, unless there is a crisis or an emergency. At national level, the Department of Special Needs Education (DSNE) has an oversight role on the implementation of inclusive education. Specifically, DSNE ensures:

- Establishment of specialist and itinerant teachers;
- Coordinating programmes of inclusive; and
- Issues related to management of SNE diploma teachers.

Malawi has taken a twin-track approach to inclusive education, where children and youth with severe impairments are educated in special schools or special needs centers, while those with mild impairments are mainstreamed (UNESCO, 2020). The Education Sector Implementation Plan II aims to strengthen inclusive education in all schools to avoid segregation. As a result, special schools at each education level are being transformed into resource centers, as specified in the 2007 National Policy on Special Needs Education. Currently, there are 150 resource centers across the 34 districts of Malawi (GIZ and Government of Malawi, 2019). Special schools also provide disability-specific instruction, primarily for the hearing and visually impaired learners. However, there are only six special schools in Malawi, all of which are residential schools, while others have been converted into resource centers to reflect a paradigm shift in policy.

Education Information Management Systems (EMIS) data collected annually, provides the basis for the monitoring framework for education. EMIS in Malawi was established in 1986 to generate quality information for planning, policy formulation and decision making (Kimura, 2005). At school level, records are collected from the class registers, aggregated and displayed in the head teacher's office. Such records are submitted to the District Education Manager (DEM)'s office. Also, the district level aggregated school level data, are merged with distinct school names and "used" for resource allocation and reporting to the Divisions and Headquarter (GIZ and Government of Malawi, 2019). At national level, the EMIS questionnaire includes the following:

- Section C on learners (c.3 orphans by standard and gender and vulnerable learners by standard and gender; and c 4 on special learning needs by standard and gender);
- Section D on infrastructure and sanitation information (D.1.a special needs resource rooms and special needs preparatory rooms; D.1.c number of disability friendly toilets; D.2.b rooms with ramps and D.2.d newly constructed infrastructure – special needs resource room and special needs preparatory rooms); Section F 3 teachers' details (in terms of disability); and
- Section F4 SNE teachers' details (GIZ and Government of Malawi, 2019; MoEST, 2018).

Malawi, through the MoEST, is adapting the existing education curriculum and thus, incorporating inclusive education within it to improve teaching and learning environments toward inclusivity. This is in line with the NIES (2017–21) Priority Area 7, 'Enabling Environment for Inclusive Education', which seeks to promote inclusion through the following strategies:

- 7.1- Adapting existing curriculum methodology, teaching and learning materials to incorporate inclusive education;
- 7.2- Equip educators, caregivers, learners and community with knowledge and skills to support inclusive education; and
- 7.3- Construct and rehabilitate infrastructure water points, sanitation facilities and resource centers.

The 2019 Capacity Assessment Report on inclusive education in primary schools, surveyed 557 schools across 33 Malawian districts. The results indicate that there is a considerable number of schools with the NIES (2017–21) document and the inclusive education curriculum materials for reference in implementing inclusive education (GIZ and Government of Malawi, 2019).

Pre-service and in-service teacher training

Pre-service training ensures that prospective teachers are skilled in inclusive teaching pedagogies when deployed to schools, while in-service teachers who receive continuous professional development (CPD) training are capacitated in inclusive pedagogy while practicing. Most of these specialist teachers have been trained by Montfort Special Needs Education College, which is the prominent training institution for teachers specializing in special needs education (Chitiyo et al., 2019). CPD was noted by the NIES (2017–21) as key to the realization of inclusive education. This is because mainstream primary school teachers who would have inadequate skills to handle children with diverse needs, would be reluctant to accommodate these children in their classrooms. Therefore, the CPD initiatives in Malawi adopts UNESCO's definition of inclusive education as a process of addressing and responding to the diversity of needs of learners through increasing participation in learning, cultures and communities, and reducing exclusion within and from education (Chitiyo et al., 2019).

Strengths and gaps on policy and practice in inclusive education

The Malawian inclusive education policies and strategies are backed by implementation plans, which promote accountability and therefore yield stakeholder political will. The implementation plans of these policies and strategies provide specific, measurable, achievable, realistic and time-bound (SMART) targets for accomplishment by the responsible parties. The National Health and Nutrition Strategy Plan (2018–20) has the monitoring and evaluation plan in Section 5 and Implementation Plan in Section 6; the National Disability Mainstreaming Strategy and Implementation Plan (NDMS & IP) (2018–23) has the implementation plan in Section 6. The National Integrated School Health and Nutrition Policy (2017) has implementation arrangements in Section 4, as well as the implementation plan as Annex 1. The backing of the inclusive education policies with implementation plans can be credited to the landmark swift development of the National COVID-19 Preparedness and Response Plan of 2020 in response to COVID-19 pandemic, covering education in emergencies under its Education Cluster in Section 4.7, in line with the Draft 2019–20 Multi-hazard Contingency Plan. This Education Cluster strives to, 'ensure that teaching and learning continues through innovative solutions and creating an enabling environment in communities with special attention given to vulnerable groups in the education sector during the COVID-19'.

The NIES (2017–21), the flagship strategy for inclusive education and education in emergencies in Malawi, has estimated the cost of inclusive education outcomes, as per its Priority Area 8, which has to date yielded positive results toward inclusivity in education. Malawi developed a costing model for inclusive education in its NIES strategy document, which estimated the cost at US\$29 million over five years. In terms of funding for inclusive education, the 2019 Capacity Assessment of inclusive education in 557 primary schools across Malawi's 33 districts revealed that sources of funding were: school improvement grants (63%); school improvement plans (24%); development fund (9%); and parental assistance (4%); thereby demonstrating political will for implementing inclusive education. This has resulted in progressive transition of the country from special schooling (discriminatory) to mainstream schooling/resource centers (inclusive) for learners with diverse needs. However, several researches have noted inadequate funding for inclusive education. The 2019 Capacity Assessment of inclusive education revealed existing gaps for funding, which include inadequate materials due to high enrollment (22.5%), lack of support materials and assistive technology (56.5%) and lack of good and accessible infrastructure (21%) (GIZ and Government of Malawi, 2019).

The greatest strength of the Malawian NIES (2017–21), is its broadness. Such an approach of not only focusing on barriers to access, but also barriers on inclusivity and participation within the schools is a good practice from the Strategy. The Strategy also covers all children likely to be excluded from and within the education system. The 2015–19 National Education Plan endorses an inclusive approach, referring to children and youth who have been marginalized or excluded, such as girls, children with disabilities, people living in remote villages and those from poor households (UNESCO, 2020). As indicated earlier, the NIES covers a total of 20 groups of learners with diverse needs or marginalized learners. This is the reason why, since its (NIES) inception, there has been an increase on enrollment of learners with diverse needs in Malawian schools. At national level, EMIS 2016/17 reports that 2.8% (146,048/5,073,729) of total primary enrollment were learners with diverse needs compared to the EMIS 2015/16 enrollment of 2.4% (120,007/4,901,009) enrolled. Distribution of learners with disabilities by gender shows that the majority of learners were having learning difficulties [62,767], followed by learners with visual impairment (low vision [35,234]; blind [496]), hearing impairment (hard of hearing [31,434]; deaf [3414]); and lastly those with physical impairment [12,801] (GIZ and Government of Malawi, 2019).

The major limitation of the NIES (2017–21) is that it is available at national level and sparingly at district and school levels. What defeats the intention of advancing inclusive education, is that those at MoEST headquarters are more familiar with the document and not in districts and schools (Save the Children, 2018). Some personnel at district level may have copies of the Strategy. However, this does not translate into standardized transmission of its contents to districts and schools (GIZ and Government of Malawi, 2019). From the 557 primary schools across 33 Malawian districts surveyed by the 2019 Capacity Assessment of inclusive education in primary schools, 84.3% reported that inclusive education guides or handbooks were not available for the school

manager (*ibid*). This defeats the goals of the NIES spearheading inclusive education, while the lack of adequate IEC materials compromises achieving inclusive pedagogies in schools.

While the country is committed to capacitating structures and systems for inclusive education as per NIES Priority Area 1, policy gaps in other policy documents work against the promotion of inclusion. Also, only 150 primary schools nationwide have resource rooms, which are not sufficiently equipped as they lack essential materials to provide quality learning (*ibid*). Also, there are 1742 specialist teachers serving in the education system mainly in primary education and these are not enough. In some cases, learners with visual impairment were noted by the 2020 GEM Report Education Profiles to have moved to schools for the blind while those with albinism are mainly educated by itinerant teachers for the blind (Lynch and Lund, 2011). Kaphle et al. (2015) established that the majority of students with refractive errors, such as myopia, were not wearing glasses in Malawi. These highlighted shortfalls undermine the commitment of the country toward inclusive education.

The NIES (2017–21) Priority Area 8 (Financing inclusive education) is not regarded as mandatory, thus creating a ‘closed gateway’ for not making provisions for inclusive education. The aggregated School Improvement Grants (SIGs) at the district are not specific on inclusive education, but more with the NESP’s thematic areas (access and equity, quality and relevance, and governance and management). In a few cases, District Education Managers (DEM) advise primary schools to allocate a portion of their funding to inclusive education; and failure to allocate funds for inclusive education results in re-budgeting. However, the decision is usually with the school management to allocate the School Improvement Grant (SIG) to inclusive education. In the same vein, at national level there is no deliberate intent and action to ring-fence inclusive education although SNE has a defined resource package. Therefore, as noted, both district and national level the inclusive education budget and its allocation is at the whim of the controlling officer and/or budget officer if it is to get any funding (GIZ and Government of Malawi, 2019). The 2019 Capacity Assessment of Inclusive Education revealed that in 557 primary schools across Malawi’s 33 districts, revealed the funds were; adequate (0.19%), inadequate (29.4%), no funding (62.69%) and no response (8.08%) (*ibid*). The existing gaps for funding were identified and included inadequate materials due to high enrollment (22.5%); lack of support materials and devices for inclusive education (56.5%); and lack of good infrastructure (21%) (*ibid*). This affects the implementation and subsequent realization of inclusive education.

Although some sensitisations were applied to raise awareness of inclusive education as per NIES (2017–21) Priority Area 1 (Capacity for Inclusive Education), there are still inherently negative attitudes and lack of political will with regard to the implementation of inclusive education (Save the Children, 2018). Also, support from the district to the schools for children with disabilities was noted to be low, which limits efforts toward the realization of inclusive education. Again the same assessment revealed that of the 557 surveyed primary schools, 50% were not visited, hence not assisted by the district SNE coordinator/desk officer, while 33.4% indicated non-support from the DEM. These are worrying trends as they signify lack of political will by these key stakeholders (Save the Children, 2018). Also, 51.92% head teachers indicated lacking knowledge on policy and the legal framework relating to inclusive education, while only 49.69% of the 557 schools had by-laws on inclusive education. This too, militates against the implementation of inclusive education (GIZ and Government of Malawi, 2019). The Policy on ECD also (2006) lacks commitment to inclusive education by failing to embed provisions for early intervention in ECD for children with diverse needs. This implies that community based child care centers will hardly contribute to inclusive practices; hence, impact on children with diverse needs’ access to education.

The national level situation reflects a “silo” approach toward inclusive education; thus, defeating the collaboration and partnership embraced by the NIES on Priority Area 6 (partnership for inclusive education). Three key directorates (Basic Education, Education Planning and SNE) of the education ministry were noted by the 2019 Capacity Assessment of inclusive education in Malawi as apparently not working as one entity. The assessment established that Directorates of Basic Education and Planning view themselves as ‘outsiders’ that only come to offer advice and support on financial and management matters (GIZ and Government of Malawi, 2019). The same capacity assessment further observed that the Directorate of SNE has been solely championing every inclusive education activity without the full participation and collaboration of other relevant players. This non-collaboration of these critical departments to deliver inclusive education, negatively impacts on the realisation of SDG 4.

While it is plausible that the EMIS data is somehow inclusive, it is both out-dated and overemphasizes SNE over inclusive education. The EMIS data in Malawi is collected at national, district and school levels. At the national level, the EMIS questionnaire includes Sections from C3 to F3, which speaks to inclusive education. The presence of data at all levels indicates a positive development, which is highlighted by UNICEF (2016a, p.12), stating that, “it is important to take stock of what is already known”. However, the EMIS data seems not to embrace all categories of learners with diverse needs under the banner of SNE. By this, it ignores the 20 various categories of learners with diverse needs, which are usually excluded from and within schools under section 1.2.1 of the flagship inclusive education strategy the NIES MoEST (2017). As indicated earlier, the EMIS data is out dated, with the latest being for 2016/2017. Given the importance of this data in informing policies and strategies for inclusive education, this is a gap that should be closed.

In terms of full practices for inclusive education in Malawi, there is still a high degree of non-inclusivity of education environments as well as in the general curriculum. A recent study of the TVET system, which included interviews in 15 public, private and community technical colleges, as well as community skills development centers, identified obstacles to inclusion (UNESCO, 2020). Facilities lacked accessibility features such as: ramps; wide doorways; good pathways between buildings, and disability-friendly

toilets. Learning equipment instructions were not available in Braille, and learning materials were not available in large print, while discriminatory employer attitudes and behaviors were also evident (ibid). According to, cited in the GEM 2020 Report, in Malawi, students with disabilities cannot benefit from information and communications technology (ICT), computer studies or science in the general curriculum because of the lack of resources.

What is clear is that the concept of inclusive education is fairly new in Malawi, such that most mainstream teachers, communities and other stakeholders are not aware of it. While some challenges have been identified, key to note is that inclusive education is a process and not an end (MoEST, 2016). While promoting inclusive education, it is vital to note that inclusive education as a concept, demands a change of mindset about education. It becomes important for Malawi to ensure that all stakeholders work together in order to ensure that no child is left behind.

Inclusive education in Zimbabwe

Zimbabwe had been seen as exemplary in the education sector, with one of the highest literacy rates in Africa (around 90%). However, there is an estimated 600,000 children with disabilities of school age in Zimbabwe. More than half have no access to education (WHO and World Bank 2011). One study suggests that children with significant impairments have been turned away from schools in Zimbabwe because teachers perceived themselves as untrained and ill-equipped to assist them (Chakuchichi and Chataika, 2013). In order to try to address this issue, the Leonard Cheshire Zimbabwe Trust and partners have been implementing an inclusive education program in Zimbabwe since 2009.

Within the Ministry of Primary and Secondary Education (MoPSE), inclusive education is the responsibility of the Learner Welfare Services, Schools Psychological Services and Special Needs Education Department. It is notable that the Constitution (2013), the Education Act (as amended in 2020), and various policy documents guarantee the right to basic education for all. The Zimbabwean Constitution of 2013 allows all learners to be enrolled at schools nearest their homes irrespective of diversity status. Thus, all schools are expected to be inclusive and a considerable number of marginalized learners and those with disabilities are enrolled in inclusive classrooms within mainstream schools. Zimbabwe has 16 official languages, with English, Shona, and Ndebele the most common. Sign Language is one of the 16 official languages in the national Constitution (Government of Zimbabwe, 2013).

The last two decades have seen Zimbabwe going through economic crises, natural disasters and political emergencies that created more education vulnerability among the usually excluded children with disabilities, those with albinism, girls, among others (Chataika et al., 2020). These crises include continuous economic crises with high unemployment rates, the land reform program, floods, frequent droughts, cyclones and the COVID-19 epidemic. Thus, it is only through an inclusive education system that the needs of historically disadvantaged learners can be adequately addressed during such emergencies.

The definition of inclusive education in Zimbabwe

The concept of inclusive education is embedded in Section 3.9 of the National Disability Policy of 2021. It does not define inclusive education as such, but indicates that an inclusive education system of appropriate standards, at all levels, as well as lifelong learning for persons with disabilities of all gender affiliations, must be ensured. In Zimbabwe, inclusive education is defined in the 2021 draft Inclusive Education Policy as:

An approach or process that seeks to ensure universal access to and participation in education for all learners through mainstreaming of responsive learner-centred support to overcome identified barriers to individual learners' full participation in formal, non-formal and lifelong educational settings and activities.

The challenge is that, it is still a Bill, which still needs to be enacted. Inclusive education is also enshrined in the Education Amendment Act of 2020 as a human rights provision. This is consistent with the Sustainable Development Goal (SDG) 4 (United Nations, 2015) and Article 24 of the United Nations Convention on the Rights of Persons with Disabilities (CRPD) (United Nations, 2006), emphasizing inclusive and equitable education. The country ratified the CRPD on September 23, 2013.

Existing policies and strategies for inclusive education

Zimbabwe has policy documents that have a direct bearing on the provision of inclusive education in Zimbabwe (Presented in Table 1).

Inclusive education may also be indirectly influenced by the following legal documents in Zimbabwe. Chief Education Officer's Circular Minute Number 12 of 1987 (Schools Psychological Services Institutionalizing Remedial Programmes) and Secretary's Circular No. 20 of 2001 (Replacement of Special Education Teachers).

The Ministry of Primary and Secondary Education (MoPSE) has a draft Inclusive Education Policy and a Practical Inclusive Education Handbook for Primary and Secondary School: The Policy has been out for public consultation forums, and will be going before Parliament soon. It is hoped that the policy will be enacted as soon as possible so that the implementation plan in the policy document can be implemented. MoPSE also produced an inclusive education handbook in 2020 to strengthen the practice of inclusive enrollment, teaching and learning processes, as well as learner support services at every school through continuous professional development. Thus, the handbook intends to strengthen teacher capacity in order to translate the curriculum principles of inclusivity, equity, and gender sensitivity and learner-centredness, among others, into practical reality. This is to ensure a strong foundation for inclusive societies, which is in line with the Constitution of Zimbabwe (MoPSE, 2021).

MoPSE has curricula that consider issues of equity. The curriculum framework (2015–22) has inclusivity as one of its guiding principles, calling for diversity education. The curriculum spelled out one of the competencies expected of learners as demonstration of an understanding of cross-cutting issues such as HIV and AIDS, sustainable resource utilization, climate change and disaster risk management. These issues are adequately being addressed in all the learning areas, especially at primary school level. Within the principle of inclusivity, the aim of the curriculum is to provide an education system that considers and addresses the different learners' needs and abilities without disadvantaging any group or individual. MoPSE, in conjunction with UNICEF has also developed a downloadable handbook that gives guidelines to educators on the implementation of inclusive education (MoPSE, 2021).

Within the MoPSE, inclusive education and education in emergencies are the responsibility of the Learner Welfare Services, Schools Psychological Services and Special Needs Education Department. It focuses on enabling all learners to access the educational facilities on offer to achieve their individual best through a range of support services.¹ However, education in emergencies is not mentioned anywhere on the function of the department, leaving it as a gray issue.

Alternative Learning Approaches, such as online lessons and distance learning approaches through radio and Television ensure that the country has procedures in place to respond to emergencies/disasters, which negatively impact on learning. This is mostly executed by the Education Cluster, led by MoPSE, co-led by Save the Children and UNICEF and comprising more than 22 partner Zimbabwe Education Cluster (2020). This structure is responsible for implementing the education in emergencies programming in Zimbabwe. This has been the approach which has been used in the face of recent emergency disasters and setbacks such as Cyclone Idai and the novel COVID-19. These disasters have exposed the exclusionary nature of the education system in Zimbabwe. The COVID-19 pandemic led to the closure of 9625 primary and secondary schools, and this was responded to by the crafting of the Education Cluster Zimbabwe COVID-19 Preparedness and Response Strategy (UNESCO, 2020c). This strategy devised various alternative learning and safe schools opening approaches under its five approaches. These are Alternative Learning Approaches (radio programming; digital & online learning; and provision of supplementary learning materials); Back to School and Opening Up Better; Safe School Feeding; Teacher Capacitation and Raising awareness for prevention and mitigation through information, education and communication materials. However, the challenge was that most learners with disabilities had to leave behind their

Table 1 Relevant policy documents.

<i>Document</i>	<i>Emphasis</i>
Constitution Amendment Act (2013)	• Section 6- recognition of sign language and 12 other minority languages as official languages • Section 19- appropriate education and training for all children • Section 20- appropriate education and training for all youths • Section 22- accessible public buildings, use and development of all forms of communication for people with disabilities • Section 27- free and compulsory education for children, same educational opportunities for boys and girls at all levels • Section 75- right to basic State-funded education • Section 83- rights of persons with disabilities to be provided special facilities for their education, and the right to state-funded education and training

Table 1 Relevant policy documents.—cont'd

Document	Emphasis
Education Act (1987, as amended 2020)	• Section 4: No child shall be discriminated against by the imposition of onerous terms and conditions in regard to his or her admission to, suspended, excluded or expelled from any school on the grounds of his or her <i>nationality, race, color, tribe, place of birth, ethnic or social origin, language, class religious belief, political affiliation, opinion, custom, culture, sex, gender, marital status, age, pregnancy, disability or economic or social status, or whether they were born in or out of wedlock.</i> • provision of sanitary wares and other menstrual health facilities to girls in all schools to promote menstrual health. • Section 5: Compulsory education, every child shall be entitled to compulsory basic state funded education parents who deprives their child the right to basic state funded education shall be guilty of an offense and liable to a fine. • Section 10: Every child of school going age shall be entitled to be enrolled at the primary or secondary school, as the case may be, <i>nearest to the place</i> where he or she is ordinarily resident, unless such primary or secondary school is fully enrolled. • Section 25: Every school shall endeavor to offer non formal education including adult education. • Section 62: Every school shall endeavor to— (a) Teach every officially recognized language. (b) Ensure that the language of instruction shall be the language of examination. (c) Ensure that the mother tongue is to be used as a medium of instruction at early childhood education. • Section 68B Pupil with disabilities 1) every registered school shall provide infrastructure, subject to availability of resources, suitable for use by pupils with disabilities. 2) the Secretary shall monitor and enter premises of every registered school for the purposes of ascertaining whether the rights of pupils with disabilities are considered during teaching and learning. 3) for the purposes of fees approval, the Secretary shall require every registered school to submit a plan highlighting how the school shall advance the rights of pupils with disabilities. • Section 68C No pupil shall be excluded from school for non-payment of school fees or based on pregnancy.
Draft inclusive education policy of Zimbabwe (2019)	• the comprehensive policy draft covers all traditionally excluded and marginalized learners such as those with disabilities, migrants, OVC, children affected by HIV and AIDS, disadvantaged children in rural and urban areas, girls, out of school youths, those with learning difficulties and refugees. • the policy calls for schools to become inclusive centers of teaching, learning and support, and with the intention to ensure allocation and effective realization of the objectives of improved access, retention, and quality educational outcomes. The first phase of policy implementation will be focusing on the following six core areas: • infrastructure • leadership and structures • material support (inclusive of learning materials and support) • Safety and protection (including Psychosocial support) • nutrition and health promotion • water, sanitation and hygiene
Zimbabwe education cluster COVID-19 Preparedness and response strategy	The strategy has five priorities guiding education response to COVID-19. These are: • alternative learning approaches (radio programming; digital & online learning; and provision of supplementary learning materials) • back to school and opening up better (infection prevention & control for safe schools; learners, teacher and staff wellbeing & welfare; psycho-social support; assessment & accelerated learning for academic reintegration; and monitoring, learning and building back better. • safe school feeding (supplementary utensils and food preparation materials; supplementary food items; emergency school improvement grants; and training for school communities • teacher capacitation (radio, digital and online programming; back to school integration; learner welfare; and prevention and mitigation. • raising awareness for prevention and mitigation through information, education and communication (IEC) materials (behavior change communication; rapid assessment and engagement of publics)

Table 1 Relevant policy documents.—cont'd

Document	Emphasis
National disability policy 2021	Section 3.9 outlines Government's obligations toward people with disabilities including the provision of inclusive education, inclusive infrastructure in schools and provision of assistive technologies
Education sector strategic plan (2016–20)	The comprehensive plan focused on promote the development of the sector for the benefit all the learners especially the vulnerable and marginalized who face the risk of not going to school.
Zimbabwe school health policy (2018)	Provides a broad frame of reference to guide the implementation of a number of health related issues relating to the welfare of learners in the school system, such as health and nutrition, education services, water, sanitation and hygiene, needs of learners with disabilities, mental health, sexual and reproductive health concerns, and the care and support provisions as well as guidance and counseling needs of all learners.
Curriculum framework for primary and secondary education (2015–22)	The framework considers inclusivity as one of the guiding principles and defines inclusivity as an education system that considers and addresses the different learners' needs and abilities without disadvantaging any group or individual
The national gender policy (2013–2017)	Fosters a gender just society in which women, girls, men, and boys should equally contribute to and benefit from all the spheres of country development.
Disaster risk management: A resource book for educational institutions in Zimbabwe (2009)	The resource book is specifically for educational institutions. It provides an inclusive response to disaster package that considers gender, disability, orphaned and vulnerable status as well as rural/urban differences.
2015 The national non- formal education policy for Zimbabwe	The policy provides a second education chance for all children, youth and adults, who through different circumstances could have missed an opportunity to enroll in formal education.
MHTES&TD strategic plan 2019–23	Promote gender equality and equity, and gender mainstreaming in colleges and universities.
Secretary's circular No P36 of 1990	Special educational provisions in ordinary schools for children with varying degrees of disabilities and special education placement and procedures for special classes, resource units and special education schools.
Secretary's circular No 2 of 2000	Guidelines on the inclusion of learners with albinism
Directors' circular number 2 of 2001	Directs sign language to be taught in all primary schools in Zimbabwe
Directors' circular No 3 of 2001-	Guidelines on providing equal access to education for learners with disabilities
Director's circular minute no 24 of 2001	Provides for braille transcription and sign language interpretation for students with visual and hearing impairment during examinations
Directors' circular number 7 of 2005	Guidelines for the inclusion of learners with disabilities in all school situations
Directors' circular 2008	Policy guidelines of assessment of learners with disabilities and special needs
Director's circular number 5 of 2011	Provides guidelines for children who live more than 5 km from the nearest registered primary school and the children who live in scattered and isolated communities
Examinations circular number 21, 2014	Language modifications and examinations Administrations for grade 7 candidates with deafness

assistive technologies at schools since they were not allowed to carry them home. This made it difficult to access online lessons as most learners with disabilities come from poor families. It implies that, most learners with disabilities hardly benefitted from the systems put in place during lockdown (UNESCO, 2020c).

Practices, systems & structures for inclusive education

The Ministry of Primary and Secondary Education (MoPSE) has curricula framework (2015–22) that considers issues of equity, touching also on cross-cutting issues such as HIV and AIDS, sustainable resource utilization, climate change and disaster risk management. The Ministry of Higher and Tertiary Education, Science and Technology Development (MoHTESTD) has not yet taken tangible deliberate action to come up with a curriculum that addresses equity issues and also lacks a structure for inclusive education and education-in-emergencies. Within the MoPSE, inclusive education is the responsibility of the Learner Welfare Services, Schools Psychological Services and Special Needs Education Department. It focuses on enabling all learners to access the educational facilities on offer to achieve their individual best through a range of support services. The Zimbabwean legal framework allows, for all learners to be enrolled at schools nearest their homes irrespective of their diversity status (Chakuchichi et al., 2012; Government of Zimbabwe, 2013). Thus, all schools are expected to be inclusive and a considerable number of marginalized students and those with disabilities are enrolled in inclusive classrooms within regular schools. Resource units/Special classes within regular schools which accommodate all learners with disabilities numbered 1851 across all provinces as noted by the MoPSE 2018 s quarter disability statistics reports. Some special classes have various types of learners with a range of impairments, others have specific disabilities. Additionally, there are more such provisions in primary than in secondary schools.

Through a partnership between the Ministry of Primary and Secondary Education (MoPSE) and the Leonard Cheshire Disability Zimbabwe, a pilot project code-named: *The Cluster Model of Inclusive Education* came into effect in January 2010. The three-year

project was implemented at sixteen schools in three provinces: Harare, Mashonaland East and Mashonaland West. The project registered significant gains in terms of enrollment. Reports indicate that over one thousand children with disabilities who had not been in schools due to lack of support and a disabling school environment eventually made it into school (Chakuchichi et al., 2016; Chakuchichi and Chataika 2014). The project saw school infrastructures being adapted, learners were provided with mobility as well as teaching and learning assistive technologies as required. Also, teachers and communities were trained in inclusive education. After the success of the pilot project, the model was extended for a further four years.

An evaluation conducted in Mashonaland West indicated that promoting the inclusive primary education project was overwhelmingly reported as relevant by 159 out of 175 teachers (Chakuchichi et al., 2016). The project was meant to support the enrollment of 1500 children with disabilities in 30 model schools; and, at the same time, ensuring the retention of 741 such children enrolled in model schools prior to the commencement of the project. The project was thus expected to provide access to primary education to a total of 2241 children with disabilities in model schools. The project supported a total of 1089 children with disabilities in model schools and a further 1843 in cluster schools. Thus, 2932 children with disabilities were supported in accessing mainstream primary school education. In addition, a total of 951 teachers were capacitated in teaching children with disabilities within an inclusive setting through training workshops. Parents and children with disabilities were also provided with training to enhance their skills in self-advocacy. Teachers rated the impact of the project highly. At least 93.14% of teachers viewed the Leonard Cheshire Disability Zimbabwe's Promoting Inclusive Primary Education project as having positive impacts on the children with disabilities, their parents, schools, communities and the nation at large. Thus, the project was seen to have given rise to increased understanding of the rights of children with disabilities in the model schools.

At the local community level, the participation of women was enhanced to such an extent that they have taken leadership posts in School Development Committees. The participants of the study were quite confident that the project produced excellent value for money. Through transport solutions and assistive technology, it enabled most of the children with disabilities in the project areas to access education and be able to remain in school for more than 80% of the required time. The model-cluster school strategy comprises one central school in a cluster with about ten schools being adapted for disability inclusion. The adaptations include infrastructure, training of teachers and local leadership and the provision of assistive technologies to learners with disabilities. The school becomes inclusive and most learners with disabilities in the cluster of the adapted school are expected to attend the school. The increase of children with disabilities to accessing nearly all schools as the ripple effect influenced school heads and teachers who also participated in exchange visits. Such visits enabled neighboring schools to adopt inclusive education practices in their schools, thus making the project having a multiplier effect in its roll out.

In order to enhance access to an inclusive and quality education by all learners, including those with disabilities, UNICEF, through the Ministry of Primary and Secondary Education provided improvement grants to 3159 out of the 3200 schools targeted (98%) across the country. The grants have contributed to the improvement of the schools' physical environment and to the availability of teaching and learning materials. Income from the grants also enhanced the retention of poor children in school by subsidizing their overall costs of education. The number of children with disabilities enrolled into the general education system as a result of this project increased from 34,734 in 2015 to 49,692 in 2016.

MoPSE, with UNICEF support and funding from the Global Partnership for Education (GPE), supported the training of over 80,000 primary school teachers in 2018 in a supplementary module to the in-service Early Reading Initiative (ERI) and Performance Lag Address Program (PLAP). The supplementary module supports teachers with knowledge and skills on how to accommodate the diverse educational needs of learners to enhance their numeracy and literacy (UNICEF, 2018). This was done in recognition that teachers needed the know-how of planning and delivering meaningful lessons for the benefit of learners who have diverse educational needs in their classes.

As indicated earlier, Zimbabwe is also implementing the reverse inclusion model at special schools such as Emerald Hill School for the Deaf, Danhiko school and King George VI. The reverse inclusion model entails that special schools open their doors to learners without disabilities and these children are enrolled in the same class. The greatest achievement associated with this model is the change of attitudes by learners without disabilities toward their peers with disabilities. In line with the CRPD, this is a great step toward reduction of discrimination. The implementation of this model is being done without the support of the government. A five-year study of this model by Hlatywayo (2017) indicated that reverse inclusion has many benefits associated with it. However, educationists in authority seem to have little understanding of the model, which may be a stumbling block for its acceleration.

Pre-service and in-service teacher training

Pre-service training ensures that aspiring teachers acquire the prerequisite skills in inclusive teaching pedagogies. Similarly, in-service continuous professional development (CPD) also capacitates them in inclusive pedagogy. CPD in inclusive education in Zimbabwe is mainly supported by development partners in education. However, in service training is being conducted in several universities at undergraduate and postgraduate levels, and these include the University of Zimbabwe, Great Zimbabwe University and Zimbabwe Open University. The United College of Education trains teachers in inclusive education at diploma level.

Strengths and gaps on policy and practices in inclusive education

Inclusive education strengths

Zimbabwe has a comprehensive and robust legal framework for inclusive education. Policy documents use *person first* language for persons with disabilities which is in line with best standards. The 2013 Constitution has specific provisions for persons with disabilities which is not the case with many other African Countries. In addition, the nation is a signatory to many international and regional legal frameworks on inclusive education and education in emergencies. In addition, Inclusive Education Policy Drafts' Implementation Plan is very clear on **who** is supposed to do **what** and **when**, which makes it easy to implement. However, the policy is still in its draft form, and might take time before it is adopted.

Gaps in inclusive education

There is no inclusive curriculum framework for colleges and universities, with inclusive education seemingly part of primary and secondary education only. The MoHTESTD has serious policy gaps in inclusive education, and yet teachers who are trained under the ministry are expected to implement inclusive education. For example, all the policy documents mainly focus on primary and secondary education leaving higher education open for segregation. The Constitution of Zimbabwe (for example, Section 83) and some sections of the Education Amendment Act (for example, Section 62) seem to imply that inclusive education is a privilege not a right. Obligation statements are preceded by conditions or caveats such as, "provided there are resources". These are regressive considering the gains that have been made. It demonstrates that for the State, the funding of disability issues and other vulnerable student identities are shifted to become a liability to development partners. There is also a discord in the definition of inclusive education within policy documents with the recently amended Education Act remaining silent on the concept. Rather, it focuses on special needs education and yet there is supposedly a transition to inclusive education. Most importantly, the funding matrix for inclusive education is not clear.

While there are milestones covered by Zimbabwe, there remain several challenges facing inclusive education, including:

- lack of adequate resources;
- inaccessibility of schools;
- ambiguity of laws and policies;
- lack of political will;
- cultural stereotypes and negative societal attitudes;
- high teacher-pupil ratios;
- curriculum inaccessibility;
- limited research. (UNESCO, 2020; Sibanda, 2018).

Still, there remain opportunities given the efforts of the government of Zimbabwe, which has invested significantly in general education since 1980. These investments culminated in the construction of several mainstream schools and training of specialist and special education teachers which can be exploited for full inclusion of learners with disabilities (Sibanda, 2018). These opportunities have increased the potential for the successful implementation of inclusive education in Zimbabwe. Furthermore, the country has now developed a draft Inclusive Education Policy, which if adopted, could change the landscape of inclusive education in Zimbabwe.

Financing education in Zimbabwe

It is not possible to speak about education in the country without considering the issues relating to the costs of education provision. Kaplan and Lewis (2013:21) posit that, "Understanding education as a basic human right takes seriously the idea of education as a public good and education which is 'market driven' works against inclusive education". It is, therefore, the Government of Zimbabwe's responsibility to adequately fund the country's education system.

It is not unusual to observe that families in rural and poor urban areas often must choose between sending a child to school or having the child work to accrue revenue to help feed the family. Such families consider education to be too expensive a market commodity in a country where many workers have joined the informal labor sector. Consequently, between 5% and 40% of students drop out, finishing with low skills and high rates of unemployment. Among the drop - outs would be those many pupils with negative learning experiences and a history of having to repeat years because of poor performance.

In Zimbabwe, low education funding remains a major challenge. It is observed that, for example, while 23% of the total Government budget in 2016 was allocated to education, 98% of that money was spent on the wage bill leaving only 2% for capital development and other non-recurrent expenditures. In 2018, 93.7% of the Ministry's allocation also went to employment costs leaving only 6.3% for education development and other important costs such as procurement of teaching and learning materials, infrastructure development, capacity and manpower development and learner welfare support. In this regard, it has also been observed that non-recurrent expenditure of \$13 million a year, which equates to \$3.34 a year per child has resulted in families being called upon to shoulder most of the school facilities and supplies through payment of fees and levies in addition to meeting other direct and indirect costs including uniforms, transport, school feeding programs, and the procurement of teaching and learning materials. The

system thus, heavily depends on parental and community support which amounts to approximately 96% of the non-salary costs. Schools in disadvantaged communities are unable to raise sufficient funds to provide a quality education for all (Chireshe, 2017). The level of fees and levies collected at a school varies in accordance with the parents' ability to pay, determining the availability of infrastructure and learning materials. This has contributed to the perpetuation of existing inequalities. Despite the assistance rendered by parent communities, development partners such as UN agencies, sister ministries and civil society organisations, the country continues to be challenged to reverse the impact on access, retention, participation and achievement of quality outcomes, which have resulted from the historical context in the country and the economic crises experienced.

The central message emerging in this section is that; "Every learner matters and matters equally" (UNESCO, 2017, p.12). Thus, inclusive education seeks to increase access, presence, participation and success for all learners in education (Ainscow, 2016). This is the objective of SDG 4. Inclusive education is not a separate strategy to be used for educating a particular group; but rather a process and a goal that represents a particular quality or characteristic of Education For All. If Zimbabwe is to realize the benefits of leaving no one behind, the need to adopt inclusive education as a national strategy for providing education, cannot be overemphasized, taking into account issues of learners' welfare and wellbeing.

Conclusions

Marginalized children are more likely to have no access to education when compared to other children. If they go to school, they have lower rates of staying at school or promotion to the next grade. Concerning inclusive education, many countries in Africa benefit from foreign donors who are involved in micro inclusive education projects. There is no systemic change and formal national inclusive policy that results in system change at a country level. Given the socio-economic and related challenges, Africa is likely to benefit tremendously from a single inclusive system. This inclusive system could have enormous benefits for literacy and numeracy levels, throughput and access to teaching and learning. Malawi and Zimbabwe have positive strides in inclusive education that other African countries can learn from. However, several challenges have been identified that can impact negatively on inclusive education in Malawi and Zimbabwe. It is hoped that the following country-specific recommendations address the challenges raised in this article.

Country-specific recommendations

Based on the discussion in this chapter, the following country-specific recommendations are offered.

Malawi

- The MoEST should consider adequately supplying IEC materials for inclusive education (such as the NIES and its inclusive education curriculum guides) to districts and schools to build familiarity with inclusive education at all levels.
- The country should prioritize financing inclusive education, especially through the allocation of School Improvement Grants (SIGs), as per Priority 8 of the NIES (2017–21).
- The country, especially the MoEST and stakeholders, should consider scaling up sensitization efforts to change attitudes and behaviors at all levels regarding inclusive education.
- Malawi should mainstream inclusive education in all educational related policies, plans, legislations and frameworks.
- EMIS data should be inclusive (disaggregated by nature & extent of disability) and up to date (current-2016/17).
- MoEST and stakeholders should consider increasing the capacities for inclusivity of the school environments and learning institutions.

Zimbabwe

- Adopt the draft inclusive education policy (which has a strategic plan) in order to implement it nationally.
- Design a clear and comprehensive framework, including a funding mechanism for inclusive education and how it will be streamlined across all education sectors.
- Capacitate education stakeholders for inclusive education.
- Harmonize inclusive education across all the legal instruments.
- Establish diversity as a cross-cutting issue within the education system.
- Ensure EMIS is implemented in Non-Formal Education systems.
- MoHTESTD should design and implement an inclusive curriculum framework for higher education.
- MoPSE to collect all administrative circulars and instruments and make a booklet out of them for easy reference and guidance.
- Design a clear monitoring and evaluation framework for inclusive education.

Introduction

The central reflection of this chapter concerns the investigation of the effects of economic crisis and austerity measures on inclusive educational policy in Greece. At times of economic crisis such as Greece experienced over approximately the last 10 years, the population's impoverishment monopolizes public dialog. In the western world, the issue of poverty is perceived by terms of undifferentiated quantitative measures of material criteria, without taking into consideration the social and cultural differences, as well as the differences in values between societies, while most of the time it is associated with developing countries (Oppenheim, 1993; Alcock, 1993). Economic poverty in Greece cannot be analyzed by traditional terms of poverty evaluation, nor can be compared with the absolute poverty of developing countries. The international economic community often seems skeptical about the effects of austerity measures on people's lives in the European Union. The statement of the Director and Chairman of the International Monetary Fund, Christine Lagarde, is indicative. In her interview in *the Guardian* newspaper, on May 25th, 2012, Lagarde said this about poverty in Greece:

I think more of the little kids from a school in a little village in Niger who get teaching two hours a day, sharing one chair for three of them, and who are very keen to get an education. I have them in my mind all the time. Because I think they need even more help than the people in Athens.

Elliott and Aitkenhead (2012).

Skepticism regarding poverty within the European Union is reinforced by the media and political rhetoric as the blame for bankruptcy is attributed to the frivolous management of finances by the countries themselves. Arguments in favor of austerity programs are often constructed through the ethical mechanisms of narrative and the rhetoric of media and political discourse (Kelsey et al., 2016; Bickes et al., 2014).

We cannot examine austerity policies and their effects on education outside of the context of globalization and neoliberalism. Free market economy, commitment to laissez-faire of markets and commitment to free trade are some of the basic elements characterizing the relationship between neoliberal policy and education (Olssen and Peters, 2005). The exercise of neoliberal policies emerged in the western world at the beginning of 1980s. It was recognized as *Thatcherism* in Great Britain, *Reganomics* in the United States of America and *Rogernomics* in New Zealand (Dowse, 2009). However, it is relatively difficult to feature the effect of neoliberal history on education, as it appears asynchronously and in different forms during the last 30–40 years. Neoliberal policies and practices have specific consequences for education, as relations between government and private enterprises are redefined. Public sector and schools are exposed to increased competition, increased accountability measures and implementation of performance and management goals (Davies and Bansel, 2007).

On the other hand, changes in global economy, trade, communication and information diffusion, changes in the ways we deal with human resources and immigration are the basic characteristics that give meaning to globalization. Transition from the welfare state to the market economy, privatization of public bodies, personalization of provided services emerge as structural influences of the globalized neoliberal policy on the way countries are governed (Davies and Bansel, 2007). As a political ideology, it is applied to every aspect of governance, including education. These policies transfer the responsibilities of the welfare state to the individual, the family, the voluntary or non-governmental organizations and to communities' charitable actions (conservative communism) (Dowse, 2009).

In a newsletter about social inclusion, the European Commission declares that in 2015, 30.2% of disabled people (31 million) faced the risk of poverty or social exclusion in the European Union. This is a much higher percentage than the corresponding data for non-disabled people; 20.8% (European Commission, 2017). The influence of those particular policies was instantly revealed in Greece during the period of economic crisis—2009–2019—by dramatic income decreases, a leap of the unemployment rate, the downgrading of insurance and retirement provisions, shrinkage of the welfare state and under-funding of health and education systems.

At the beginning of March 2012, the Ministry of Education issued a circular regarding the support of students to deal with cases of malnutrition. The Ministry called School Principals, Teachers' Associations, in cooperation with Parents and Guardians' Associations to contact with municipalities' social services and Holy Metropolis in order to deal with nutrition problems (Ministry of Education et al., 2012).

The debt crisis and austerity policy in Greece reveals and crystallizes the real intentions of government from 2010 to 2011, with the "down-sizing" of welfare state and public infrastructure through the announcement of shrinkage of 151 Public Enterprises and Entities. Thirty-one associations working with and on behalf of people with disabilities were included in the list of targets (Ministry of Finance, Special Secretariat for Public Enterprises and Entities, 2011).

From 2009 to 2012, total expenditure for education dropped by 16% according to the estimates of the General Secretary of the Federation of Secondary Education Officers (Education Department, 2011). The shrinkage of the Education budget precipitated the merging and abolition of schools. In total, 1933 schools merged, representing 1056 school closures. 851 primary schools and 205 secondary schools were closed (Ministerial Decision, 2011). Moreover, in 2016, the percentage of people with severe or mild disability (aged from 16 to 64 years old) that were at risk of poverty or social exclusion in Greece amounted to 51.9%, surpassing the average index value of 27 countries of the European Union, that amounts to 37.4% (Development Center for Education Policy of General Confederation of Greek Workers, 2018).

According to data for the year 2016, Greece is included among state-members of the European Union with the largest inequalities regarding access to education for disabled people over 16 years of age. Their participation rate in education is significantly reduced as the level of education increases. Corresponding research for Europe regarding the education of disabled people of preschool and school age does not exist. Respectively, in the Greek Statistical Authority, data about education and particularly data about compulsory education of disabled students are incomplete.

According to the last statistical data of Eurostat for the year 2017, the total population at risk of poverty or social exclusion in Greece amounts to 34.8%, occupying third place among 28 countries of the Eurozone (Eurostat, 2018a). Additionally, according to the last data of the Greek Statistical Authority for the year 2017, the percentage of people experiencing material deprivation at ages 0–17 years old amounts to 38.3% (Greek Statistical Authority, 2019).

The political and economic context of Greece has profound implications for inclusive schooling. The current study presents the impact of austerity measures on inclusive education in three sections:

1. An examination of how education policy, under the pressure of austerity measures, addresses disability.
2. An analysis of the impact of austerity on education policy decisions regarding the further segregation of students and schools.
3. An examination of the shrinking of free public education in the context of the economic crisis and austerity measures.

The disability as a matter of rationalizing expenditure

Inclusion as political act is revealed as a struggle against power abuse, as identified in inequalities maintained by the hierarchical structure of the education system. Educational inequalities are exacerbated in periods of economic crisis by significant cuts in expenditure.

Recognizing and responding positively to student differences in schools is considered a major cause of waste that must be reduced. The political discourse separates education from the values of community, humanism, acceptance of difference, and critical approaches to pedagogy in the name of efficiency, serving the wider imperative of austerity policies (Giroux, 2010). Almost from the beginning of the economic crisis, disabled students became objects for economic management. The austerity measures were imposed as an antidote to the so-called irrational financial management of previous years (Runswick-Cole and Goodley, 2015). This position is reflected in official discourse. Disability was treated as an expense to be avoided. The economic crisis privileged the medical model of disability applied to schooling through neoliberal economic rhetoric. The Special Secretary of Primary and Secondary Education—Ministry of Education held a meeting about Attention Deficit and Hyperactivity Disorder (ADHD) on April 2012 in Athens. His speech is an example of "cruel optimism" expressing his belief in the necessity of austerity policies (Runswick-Cole and Goodley, 2015). The Special Secretary said:

... Our goal is the interdisciplinary diagnostic teams ... to be present in schools, in order to act directly and avoid every kind of expenses: expenses regarding time or economical, mental, learning

Esos.gr (2012).

In the context of the rationalization of expenditure on education during the period 2014–2018, two different structures of diagnostic, educational evaluation and support for students with disabilities were established. Their purpose was to ensure equal access of all students to education and to protect the psychosocial development and progress of the child and to enhance interdisciplinary collaboration in the general school (Law, 2018; Ministerial Decision, 2014; Law, 2012). The aim of the legislators was more to harmonize with the international conventions on the rights of the disabled students in education (Law, 2012) than to commit to the implementation of this ambitious project. The above finding is presumed by the fact of the lack of funding for education.

According to Eurostat data, the total expenditure of the General Government for education as a percentage of GDP amounts to 4.5% for the year 2013 and falls to 3.9% for the year 2017 (Greek Statistical Authority, 2019). In addition, during the year 2017–2018, 79,934 students with disabilities or special educational needs attended general schools. 57.3% of students with disabilities or special educational needs in general schools did not receive specialized support. The number of students receiving specialized support is dramatically reduced during the transition from primary to secondary education, where more than 90% of students were supported only by teachers of general classes without additional support or adjustments. It is worth noting that at a rate of 1.70% the coverage of the educational support expenses of the disabled students was borne by the students' families themselves (Disability Observatory of the National Confederation of Persons with Disabilities, 2019).

In the last decade, diagnostic and support structures have been used as mechanisms to identify student differences and not as structures to support and promote inclusive education for all students.

The meaning attached to the rationalization of spending on education in times of austerity usually disguises spending cuts. The disabled student is a costly student whose educational needs are placed in the context of immediate cuts in times of financial crisis. The cost of spending is passed on to the family, objectifying this shift of responsibility from the state to parents. A kind of ideological austerity is formed in addition to the economic austerity within the educational system, creating a school without choices for disabled students and their families. This ideological austerity characterizes the decisions of the educational policy, from the beginning of the crisis until today (Nteropoulou and Slee, 2019), without exceptions in the political orientations of different government formations in accordance with the policy decisions taken on macroeconomic management (Hayes, 2017).

Separate schools for different students

Existing legislation in Greece commits to secure for all citizens with disabilities and certified special educational needs equal opportunities for full participation and contribution to society, independent living, economic self-sufficiency and autonomy, full consolidation of their rights for education and social and vocational inclusion (Law, 2008, article 1). This commitment results in expectations for change of educational policy, as it is self-defeating in three basic ways:

1. The wording of the purpose and pursuits of the education of disabled students,
2. The diagnostic process regarding disabilities and special educational needs, and
3. The preconditions for students' attending general education.

Specifically, the wording of the purpose and pursuits of legislation makes it obvious that the success of educational, social and vocational inclusion is closely related to the individual abilities of students and impairments of functionality (Law, 2008, article 2, paragraph 5). Accordingly, the goals of education are achieved through the timely medical diagnosis and evaluation of special educational needs by official diagnostic bodies (Law, 2008, article 2, paragraph 6; Law, 2018, article 7, paragraph 2). The categorization of the student population, which is directly related to clinical perception of disability, individualizes the practices of treatment of disabled as deficient, perpetuates social discrimination and suspends the dynamics of a political, collective organization and representation of disabled people (Siebers, 2008). The continuous discrimination of students is not an act of acceptance of difference or otherness, but a practice of controlling groups of within the student population that seem to "disturb" the *normality* of general education. For example, the legislative framework gives the opportunity to students to remain and attend a regular neighborhood classroom only when they have mild learning difficulty (Law, 2008, article 6). Students may be supported by a special education teacher according to the kind and degree of their special educational needs. However, when they have more severe special educational needs, they must attend separate special classrooms, paradoxically called "inclusion classrooms". Students who face difficulties in attending inclusion classrooms are excluded from general education and attend separate special schools (Law, 2008, article 6).

The arbitrary nature of diagnostic practice regarding the attribution of the label of "special educational need" defines the educational life of student population cohorts, particularly of those students growing up in adverse social conditions. According to the legislative framework, students with social difficulties, delinquent behavior due to abuse, parental neglect and abandonment, or due to domestic violence belong to the group of students with special educational needs (Law, 2008, article 3). This results in the registration of those students in special schools without the justification of a report that certifies their mental, sensory or other impairment, but with the single excuse of their burdensome social identity.

Education policy has appropriated and weakened the subversive character of inclusive education discourse, by enhancing, through institutional discourse and institutional regulations, the conviction that inclusive education is a modern direction of special education (Slee, 2004) and a tool for the assimilation of students with cultural, national and religious differences as well as refugees. Inclusion is perceived as a worrying and provocative activity, when its political discourse approaches critically the system of social values, structures and institutions (Barton, 2008). Inclusive discourse as a fundamental struggle for changing the educational system ought to lead us in cultural alertness, aiming at the transformation and restoration of every kind of educational exclusion (Slee, 2004, 2011, 2012, 2018). The change is not about assimilation, but transformation of structural barriers of change in the academic community and schools (Whitty, 2002; Gillborn and Youdell, 2000).

The identification of inclusive education with special education is revealed in educational techniques regarding the management of difference. These techniques focus on deficit, diagnosis, categorization and individual treatment with the purpose of regulating the devalued differences. It is, also, evident in the formation of attendance structures (general classroom, special classroom, parallel

support, special school), in the discrimination of educational specialties and specializations (general education teachers, special education teachers), in the discrimination of curriculum, in the registration procedures in schools and in many other areas (Nteropoulou-Nterou, 2012; Nteropoulou-Nterou and Slee, 2019).

Shortly before Greece entered the International Monetary Fund (IMF), the action plan of the new elected government about changes in primary and secondary education was publicly available. Entitled, "The new school: the student comes first," the plan is committed to future reforming initiatives from preschool to secondary education (Ministry of Education, Lifelong Learning and Religious Affairs, 2009). In the second section of the text, a reference is made to inclusion and special education. Examination makes clear that in the section of programmatic commitments about inclusion, disabled students are not included, but only students from the Muslim minority of Thrace, foreigners, repatriated students and Roma. The educational issues of disabled students are included only in the section of special education (Ministry of Education, Lifelong Learning and Religious Affairs, 2009). Inclusion appears as a programmatic objective that does not concern all students, but a particular group of students with cultural differences.

In the period of economic crisis, Greece also faced the refugee issue. According to Oliver (2004), war and poverty are the two main causes of impairments. War brings poverty, injuries and refugees. Many refugees' and disabled students' experiences are characterized by life-threatening psychological and material deprivation. At the same time, the dominant value cultural position of the general school treats them as the "other," as the "intruder" (Barnes et al., 2002). Xenophobic perceptions and dominant social values form identities. The way we perceive ourselves and the way we feel when we are judged by others is of nodal importance. It forms the degree of self-esteem and empowerment, properties that are usually perceived as issues of personal choice, overlooking the degree of influence of the hegemonic social values on personal experience (Galvin, 2006). It is worth noting that the total number of refugee students deserving international protection that attend Greek public schools is 12,867 students. More specifically according to the Ministry of Education, during the school year 2018–2019, 4050 refugee students attended reception classrooms in schools of primary and secondary education, 4240 students attended schools without reception classrooms, and 4577 students attended structures for the educational support of refugees (Ministry of Education, Lifelong Learning and Religious Affairs, 2019a).

On May 30th, 2019, at the presentation of the Annual Report of UNESCO about immigrants' education, the Undersecretary of Education referred to the state's actions for the combat of discrimination in Education and the progressive inclusion of refugees in the Greek educational system. She characteristically said:

... we formed the action plan for the smooth inclusion of refugee children in the educational system, by creating Structures for the Reception and Education of Refugees ... staffed all the Hosting Centers of Greece ... It is our obligation to invest in education as it is the place that owes and can reduce social inequalities, combat prejudice and racist perceptions and defend all children's rights, without any kind of racial, national, religious, gender, social or economic discrimination.

Ministry of Education, Lifelong Learning and Religious Affairs (2019b).

According to the Minister, inclusion is perceived and promoted as an integration tool through the establishment of special structures that function either as separate schools within the refugee camps or as special separate classrooms called "reception classrooms" in general schools. The inclusive approach of education, in political discourse, is approached by idealistic terms and terms of self-complacency, downgrading the importance of social barriers and inequalities that are systematically produced and reproduced by and within the education system (Roulstone and Prideaux, 2008).

An example of downgrading the importance of social barriers is the recent angry reaction of a Parents' and Guardians' Association in an island province of 33,000 inhabitants. The Parents' Association sued a teacher of parallel support in a primary school, because she defended the right of eleven refugee students to attend classrooms of educational support in their children's school. Parents asked for compensation of 50,000 euros from the teacher for calling them "racists" and "insulting their honor and reputation." It is worth noting that in the area of the northern Aegean, the rate of unemployment for 2018 was 22.3% (Greek Statistical Authority, 2019).

Parents argued that the schooling of refugee children cannot be provided against Greek students' rights and against islanders' public health. It is worth noting that Greek students attending all-day school and refugee students had their break in different yards, while there were also separate toilets and desks. In this xenophobic climate, the teacher stated in her interview on an educational portal on June 27th, 2019:

Education sector has to shield against arbitrary and illegal practices of members of Parents and Guardians' Associations that desire with humble motives, that violate the internationally guaranteed children's rights ... Teachers should not be afraid or terrorized. This is my message to all my colleagues ...

Vainanidi (2019).

It is a fact that many Parents' Associations from all over Greece as well as many other educational bodies supported the teacher for her attitude. The Ministry of Education also condemned Parents' and Guardians' Association's suit against the teacher that defended refugees' schooling, pointing out in a press release on June 17th, 2019 that: "... the mission of teachers is the education of students based on values of solidarity and collectivity" (Ministry of Education, Research and Religious Affairs, 2019c).

However, the point is not only about an official condemnation of a xenophobic event. Inclusive education is not a matter of dealing individually with social barriers. Teachers' exposure to the anger of social groups that, in the years of crisis, were struggling materially is an extremely dangerous and lonely experience.

In the context of neoliberal political commitments, economic poverty and competitive individualism, the transfer of responsibility for inclusive education to the individual conscientiousness of teachers tests the strength of the educational community. In an environment that appears hostile to pedagogical values, the danger of teachers' frustration looms and "collective indifference" through to hostility is exacerbated in weakened communities (Bousquet, 2008; Slee, 2012). The responsibility for cultural vigilance should not be taken only by teachers, but also by the state. However, the role of "cultural advocate" is annoying for those who approach inclusive education as a technical issue and deal with it through bureaucratic assimilationist decisions. The transformation of inclusion into conditional inclusion (Corbett and Slee, 2000) results in the transfer of educational policy's responsibilities to the low-paid teachers.

Seeking the free character of public education

Until today compulsory education in Greece is public and free (The Constitution of Greece, 2010, article 16, paragraph 4). However, the problem of a "shadow education" system, namely private tutorials, which existed before economic crisis has been extended. Never before were private teachers present in public schools, particularly with the responsibility to support disabled students in general classrooms.

In 2013, within the economic crisis, private parallel support is enacted by the state, within Law 4186. The disabled student can be supported in the general classroom by a special teacher appointed and paid for by the student's family (Law, 2013). The state seems to transfer the responsibility of the student's educational support and inclusion in general classrooms to the family. The student's family avoids registration and attendance at a special school, by hiring a private teacher. Disabled students' families take up the role of employer and, according to financial capacity, hires supportive personnel in the neoliberal context of public and free education. It seems that the inclusive school is more hospitable for students whose families can afford this expense. This fact further enhanced discrimination between families as well as between teachers. Discrimination between teachers results from different employment contracts of educational personnel. The teacher who is hired by the family to support the disabled student is perceived as a "foreign body" by the educational community, a fact that leads to unequal educational relations and difficulties in sustaining cooperation between teachers.

It is well known that education is the vehicle for dealing with poverty and social exclusion and for securing welfare (Barnes and Sheldon, 2010). However, currently, this general principle seems to be shaken, if we consider the last data of Eurostat about graduates of tertiary education in the European Union. Specifically, 10.9% of the EU population with a tertiary education were at risk of poverty or social exclusion. This ranged from the lowest at 3.2% in Malta to the highest at 19.7% in Greece (Eurostat, 2018b).

Although the spigot of placements in the public sector has narrowed due to the reduction of budget expenditure in Greece, the sector of public education still offers teachers some working opportunities with fixed-term contracts, in order to cover identified needs of schools. The existing jobs that seem to still absorb a number of teachers in public education are those concerned with supporting disabled students in general education. These jobs are predominantly funded by the European Community Fund (Ministry of Education, Lifelong Learning and Religious Affairs, Press Office, 2013).

According to the data of the Ministry of Education, during 2014–2015, 6308 teachers were hired with fixed-term contracts, 8623 in 2015–2016 and 10,700 teachers were hired in 2016–2017 (Ministry of Education and Religious Affairs, 2017). Additionally, the Ministry of Education committed to, until the autumn of 2019, proceed with 4500 permanent placements in Special Education for the school year 2019–2020 (Ministry of Education and Religious Affairs, 2019a,b,c,d). Finally, 3445 teachers were appointed in August 2020. These are the first mass appointments of special education teachers in the last 10 years (Ministry of Education and Religious Affairs, 2020).

The typical qualification that teachers must have in order to be placed in those jobs is, among others, the postgraduate degree in special education (Law, 2008, article 20, paragraph d).

In the context of a desperate search for a job in public education, we note an intense participation of teachers in offered postgraduate and training programs. A new market is being formed within Higher Education. Attending postgraduate and training programs results in raising hope for employment for an increased number of teachers, as they are given the opportunity to work in educational structures and mainly in inclusive educational structures for disabled students. Universities, after the expenditure cutting for education, are concerned with the decrease or restraint of cost of the services they offer in order to secure their survival. It is worth noting that, according to the data of Eurostat, republished by Greek Statistical Authority (2019), total expenses of General Government for education as a percentage of GDP amounted to 4.5% for 2013 and ended up at 3.9% for 2017. Fourth in a row from the bottom of the countries of Eurozone. In the last three positions are Ireland with 3.3%, then Italy and Slovakia, both with 3.8% with respect to the total expenses of the General Government for education as a percentage of GDP (Greek Statistical Authority, 2019).

To be able to meet the requirements of the new economic situation, universities are oriented toward specialization, by means of postgraduate programs, and toward groups of students that can afford the tuition fees. In this way, the cost of postgraduate studies is transferred to teachers who, in their desperate effort to find a job, must cover the expense. On the other hand, Universities enter into

to creating the market conditions and business practices in the so-called public and free Higher Education Institutions ([The Greek Constitution, 2010](#)).

In 2013, postgraduate programs in special education were limited in number and demanded tuition fees ([National and Kapodistrian University of Athens et al., 2013](#)). The number of postgraduate programs in special education offered by Higher Education Institutions across Greece grows rapidly; 53 postgraduate programs for the academic year 2018–2019 ([Ministerial Decision, 2019a,b,c,d,e](#)). The demand for attending postgraduate programs is extremely high. The postgraduate program in Special Education of the Department of Early Childhood Education at the National and Kapodistrian University of Athens is a typical example. During the decade 2009–2019 the applications for the Postgraduate Program were 2849 for a total number of 200 positions ([Postgraduate Studies Program in Special Education, 2019](#)). According to the data of [Greek Statistical Authority \(2019\)](#), the total number of postgraduate students for the period 2012–2013 was 33,687, while for the academic year 2016–2017 they doubled and amounted to 66,295 postgraduate students.

In the period of economic crisis and after the memorandum, the increase of placements of teachers in inclusive and special education structures seems to upgrade the interest of educational community for inclusive education. Moreover, inclusive education, which is considered as the modern direction of special education, is projected by the representatives of educational policy as a high priority objective for the government. Characteristically, on the occasion of teachers' appointments, the Minister of Education stated:

The right to equal access for all children, including disabled children, is a high priority goal for the government. The upgrade of Special Education is distinct and unquestionable. The effort to improve the educational conditions for all students, without exceptions, in a public school that promotes solidarity, cohesion and acceptance of the difference continues with unwavering determination.

Ministry of Education and Religion Affairs (2018).

The use of the word "difference" is perceived as euphemism for "*not normal*". Based on the perspective of consensualism, possibly conflicting properties such as social class, race or disability, are not perceived as important forces that can influence the course of an educational system. These factors are defined as individual properties rather than structural mechanisms supporting the production and reproduction of unequal relations in education ([McDonnell, 2012](#)).

Throughout the last decade, inclusive education in Greece operates as a life boat for the employment of teachers, for the market development in the context of public Universities and for the political scene of the country as it uses inclusive education as the frontpiece of social policy ([Nteropoulou-Nterou and Slee, 2019](#)).

Conclusion

In times of austerity and financial crisis, it was observed that the segregation of students based on their diversity increased, diagnostic and supportive institutions are used as mechanisms for identifying difference and not as structures to support and promote inclusive education. It has also been observed that confusion is perpetuated about the conceptual appropriation of inclusive education by special education. There has been a tendency to reinforce segregation policy in teacher education in the name of the teacher's specialization to support the so-called inclusion of disabled students. The individual responsibility of teachers in addressing the problems arising from the divisive education policy, the individual initiative of families to provide educational support to their children in the context of public education remain modern examples in which the proclamatory political discourse for inclusion seems to be stripped baer.

Inclusion, as conditional inclusion or neo-special education, is empowered in the context of economic crisis and austerity measures and presents itself as a realistic, directly applicable educational practice. Still, the education policy of the country produces exclusionary education systems and does not seem committed to the vision of an inclusive education inspired by the principle of cultural vigilance, which can constitute the vehicle of a collective demand for social justice. It creates a climate of individual resolution of differences in those involved in education, without focusing on the full development and empowerment of human potential, the development of creativity and the effective participation in the educational happenings and society ([Byrne, 2013](#)). Inclusive education has been reduced to another bureaucratic discussion about monitoring and dealing with students in the education system.

In the context of the imposed Structural Adjustment Programs and austerity policies, the legislative framework is indeed reproducing the aims of discriminatory special education in the preconditions of attendance, the offered educational services and the perception of students' difference, shaping an inclusion under conditions ([Roulstone and Prideaux, 2008](#)). In times of austerity the gap between the political discourse on inclusion and the educational reality is evident in the context of implementing continuous practices of separating different groups within the education system ([Tomlinson, 2005](#)). The cloudy and confused vision about inclusive educational policy that existed in Greece before the debt crisis period, has transformed into a management problem of expense rationalization in the after-debt crisis period. In the context of ideologically and economically weakened periods, we need to reconsider ways that will allow us to free the right to attend general school from the biological, social and cultural diversity of the students and means that will enable us to stop further education segregation policies.

Introduction

Over a quarter of a century has passed since the Salamanca Statement and Framework on Action for Special Needs Education pronounced inclusive education as “the most effective means of combating discriminatory attitudes, creating welcoming communities, building an inclusive society and achieving education for all” (UNESCO, 1994, p. ix). According to inclusive education scholars (e.g., Ainscow et al., 2019), the Salamanca Statement has had and continues to have a major worldwide influence on many countries in adopting and developing inclusive education policies and practices for all learners regardless of their diverse backgrounds or profiles.

In contrast with many countries around the world that have officially embraced inclusive education as a core educational agenda to transform their education systems in order to become more inclusive of all learners, Singapore remains an anomaly in that it has yet to officially adopt inclusive education as an educational agenda within its education system. Singapore did not participate at the World Conference in Special Needs Education at Salamanca and was not a signatory to the Salamanca Statement and Framework for Action on Special Needs Education. To inclusion advocates, Singapore’s non-adoption of inclusive education as official policy can appear baseless considering that its success and stability as a racially, culturally, linguistically and religiously diverse nation rests upon being an inclusive and socially cohesive society.

It can also seem ironic that inclusive education does not have a formal role in the education system since Singapore has an aspirational vision of itself as an inclusive society for its citizens, in particular for those with disabilities. In this article, we have chosen to focus on inclusive education for persons with disabilities for the reason that persons with disabilities were explicitly mentioned as part of its inclusive society vision announced in 2004 which was then followed by the most progressive measures and efforts ever to promote their quality of life and inclusion within society. Hence, in spite of the lack of a formal endorsement of inclusive education as official rhetoric and policy, Singapore has witnessed an unprecedented slew of national developments over the past eighteen years to support and include children, youth and adults with disabilities within mainstream education and society, as particularly evident in the exponential growth in the number of students with disabilities enrolled within mainstream schools (Choo, 2019; Toh, 2018).

To make sense of and appraise Singapore’s approach and its developments toward inclusive education, this article provides an understanding of inclusive education that is situated within Singapore’s own unique socio-historical and socio-political context. For this purpose, we draw upon the cultural-historical framework (Kozleski et al., 2011) that seeks to re-understand inclusive education as situated within larger cultural historical contexts where its influence and implementation are circumscribed within and mediated by national priorities, historical legacies, competing discourses, sociocultural constructions of difference and other relevant contextual variables. This foregrounding of history and culture within the context of Singapore is invaluable to framing the understanding of Singapore’s approach to inclusive education and its developments toward inclusive education, which are described and discussed in this article.

The cultural-historical framework

Even though inclusive education and its interpretation and implementation occur within national contexts, each with unique socio-historical, socio-cultural and socio-political legacies and conditions, researchers in inclusive education tend to under-theorize, under-estimate and even ignore contextual complexities that inevitably influence the development and challenges of inclusive

education (Kozleski et al., 2011; Lim et al., 2019). A positive development that has emerged in the field of inclusive education over the past decade to recognize and highlight the influence of context on the evolution of inclusive education is the cultural-historical framework (Kozleski et al., 2011) that highlights the significance of history and culture in providing the foreground to better understand the development of inclusive education within a particular context.

The cultural-historical framework highlights that the translation of inclusive education from universally mandated intent to actual practice within a context is often influenced and affected by more encompassing societal and national conditions and developments that are further embedded within a complex, volatile and interdependent global context. Hence, variations across countries in their local interpretations and implementations of inclusive education, from the perspective of the cultural-historical framework, are hence not so much construed as aberrations from the norm, but rather are better understood as legitimate expressions of a country's construction of and response to difference within the larger scheme of nation-building at a particular point in time (Lim et al., 2019). The cultural-historical framework therefore provides a situated perspective of the developments hitherto in the fields of special needs education, disability and inclusive education within Singapore and alerts us to be cognizant that past, present and future developments in these fields are circumscribed by larger contextual legacies, priorities and forces.

Singapore: contextual legacies and priorities

Singapore is a small and densely populated (with a population of 5.5 million) island city-state located at the base of the Malay Peninsula in Southeast Asia which became an independent nation in 1965. Singapore has a multi-ethnic, multi-lingual and multi-religious population. Its citizens are categorized into four main groups: Chinese, Malay, Indian and Eurasian. There are four official languages in Singapore, namely English, Mandarin, Malay and Tamil. English is the medium of instruction in schools. According to a 2014 analysis by the Pew Research Center on global religious diversity, Singapore was found to be the most religiously diverse country in the world. With a diverse multiracial, multicultural, multilingual and multi-religious population that is packed densely within a little over 720 square kilometers of land size, Singapore is also one of the most peaceful (Global Finance, 2020) and safest cities (Economist Intelligence Unit, 2019) in the world.

Singapore's meteoric rise over the course of five decades to become a global city-state par excellence and an exemplar for successful multiculturalism is a well-known success story that is all the more remarkable in light of the odds that conspired against its survival and chances for success during its early years of independence: its fractured inception as a nation, tense race relations, socio-political and economic unrest, and bereft of its hinterland and natural resources after its separation from Malaysia. As a member state of the United Nations since September 21, 1965, Singapore's application to join the United Nations on September 3, 1965 to gain international recognition of its independent sovereignty was precipitated by its painful separation less than a month before on August 9, 1965 from the Malaysia Federation (Lim, 2019). Thrust abruptly into independent statehood, Singapore's uneasy birth as a sovereign nation was tearfully announced by its founder and first Prime Minister, Mr. Lee Kuan Yew, in a televised news conference as a "moment of anguish." As a fledgling sovereign nation without natural resources, including sufficient water of its own and limited land, and compounded by racial tensions, mass unemployment, housing shortage and economic unrest, the birth and early years of Singapore's independence were marked by an acute sense of its vulnerability.

Confronting its own innate vulnerability and its risks for instability by its pioneer leaders and its people, however, helped define a primordial source and distinctive positive force for Singapore's survival, growth and development. The narrative of vulnerability, which continues in Singapore's national consciousness, galvanized the wherewithal of the pioneer generation to transcend its beleaguered state of existence to become a country that is a world of difference from what it was. What fueled the process of Singapore's transformation since its "breakup" with Malaysia is aptly conveyed in Derek Walcott's sublime epigraph from his Nobel lecture which has been cited to capture the essence of Glissant's existential ontology of difference: "Break a vase, and the love that reassembles the fragments is stronger than the love which took its symmetry for granted when it was whole" (cited in Headley, 2012, p. 59).

It is no wonder therefore that Singapore's ontological relationship with its own sense of vulnerability has produced national educational epithets like "No-one owes Singapore a living," and has also shaped and fostered the national characteristics of tenacity, determination, self-reliance, competitiveness, efficiency, a keen sense of urgency, and "planfulness" for the future. Through sheer will, girded by these qualities, Singapore delivered itself from the angst of its vulnerability to become a country whose global significance and reputation in the world punches way beyond its little size and weight.

The historical legacy of Singapore's narrative of vulnerability and the passionately sustained tenacity it has taken for its government and people to overcome its adversities to become an exceptionally prosperous, successful and peaceful country has left an indelible stamp on Singapore's approach to framing and justifying its nation-building efforts especially in the key areas of social, educational and economic development. It is an approach toward matters of governance, policy making and national affairs that is strongly characterized by pragmatism focused on outcomes rather than alliances with ideological positions (Quah, 2018; Tan, 2012), and is upheld in "fostering a harmonious, inclusive and prosperous society" (Ghosh, 2018). Singapore's pragmatic stance to all its affairs as a legacy of its vulnerability narrative and reinforced by its outstanding accomplishments based on a focus on achieving realistic and practical outcomes rather than ideological alliances, has apparently also influenced its response and approach to inclusive education.

Toward inclusive education

Singapore's historical developments in the fields of disability and special needs education can be categorized into two eras—before and after 2004. Before 2004, special needs education in Singapore was largely identified with and associated with the special education system comprised of voluntary welfare associations (known currently as Social Service Agencies) charged with the operation of special (or special education) schools and adult disability services. A dual system of education was clearly in place in which students with and without disabilities were seen as belonging to the special education system and mainstream education system respectively (Lim and Nam, 2000). The integration, instead of the inclusion, of students with disabilities into mainstream schools was the prevailing philosophy and practice of the pre-2004 era (Lim and Nam, 2000; Lim and Quah, 2004; Quah, 1990, 2004) where the onus of responsibility laid with students with disabilities to keep up with the academic performance expected of all mainstream school students to pass national examinations. The prospects for inclusion or inclusive education to make headways were dim in this first period of the history of special needs education in Singapore (Lim and Nam, 2000; Lim and Quah, 2004; Lim and Tan, 1999).

The emphasis on integration echoed the beliefs and sentiments of the pre-2004 era which were defined and influenced by the report of the Advisory Council on the Disabled (1988) entitled "Opportunities for the Disabled"; the most relevant national document existing at that period. This document stated: "Whenever appropriate and feasible, special education should be provided within the regular educational system. A child should only be placed in a special school if he cannot be well educated in a regular school" (pp. 37–38). This report also recommended that: "integration should fit the disabled child to the most suitable educational environment" (p. 38); however, in reality during that time period, special education services were generally provided outside the mainstream education system (Quah, 1993).

By 2003, it was becoming apparent that the increasing number of students with disabilities enrolling in mainstream schools was a cause for concern because of the limited amount of support mainstream schools had for them. The increase in students with disabilities in mainstream schools is attributed to strides made by the Child Development Units in their early detection and intervention programs, the pre-school integration effort, and the fact that children with disabilities or developmental delays, whether diagnosed or latent, were being enrolled by their parents in mainstream schools. While the government still remained strongly in favor of integrating only those students with disabilities who were able to cope with the rigorous pace of the mainstream setting, and did not require accommodation beyond what was present in the mainstream education system, by 2004, it found that this was not a stance that it could maintain given the report that 20% of the school population entering mainstream schools had learning disabilities (Basu, 2006).

Hence, by 2004, more encompassing measures were needed to support the increasing number of students with disabilities within the mainstream education system. This untenable situation of underserving the educational needs of swelling numbers of students with disabilities in mainstream education provided the opportune moment to think and move beyond integration.

The year 2004 has been described as the watershed year (Lim and Thaver, 2018) for the fields of disability and special needs education in Singapore due to the explicit mention by the Prime Minister of Singapore, Mr. Lee Hsien Loong, of persons with disabilities as part of the envisioning of Singapore as an inclusive society in his inauguration speech in August 2004. About a month after his inauguration, Prime Minister Lee committed his government to this vision of an inclusive society through education by calling for better efforts to integrate students with disabilities within mainstream schools (Teo, 2004). The recognition from the Ministry of Education that children with disabilities could benefit from their inclusion within mainstream schools with the appropriate supports clearly conveyed Singapore's initial shift toward greater openness to inclusive education.

Situating inclusive education within Singapore

Singapore's shift toward a greater openness to inclusive education by changing mainstream schools to better accommodate students with disabilities was a practical response, beyond integration, to supporting their educational needs. Singapore, however, has not turned to nor embraced inclusive education as official policy to support Singapore as an inclusive society. To make sense of Singapore's approach toward inclusive education is to further contextualize it within Singapore's larger national priorities during that period. Prime Minister Lee's envisioning of Singapore as an inclusive society in 2004 which explicitly included persons with disabilities followed soon after by his call to better support students with disabilities in mainstream schools, was, in retrospect, embedded within a larger nation-building agenda.

The new dawn in Singapore's sociopolitical history in 2004 provided the driving force for the government to build the "heartware" and "hardware" for Singapore's bold new plans for self-transformation in order to continue to thrive in a world rapidly shifting toward globalization and global competition for talent and jobs. Staying cohesive, united, inclusive, aspirational and rooted to Singapore (i.e., the "heartware") would create a greater and more secure sense of Singapore as home, and "hardware" infrastructural developments would create a more livable and globally attractive city. Although there is little doubt that Singapore has always been changing itself in response to the larger global society, the launch of its own self-transformation and re-invention during the years following 2004 took on a new level and momentum without precedent.

The re-invention and transformation of Singapore was announced by Prime Minister Lee in his first May Day message after taking office, as necessary to staying ahead of rising competition especially from countries within Asia (Ministry of Information, Communication and the Arts, 2005). Billions of dollars were poured into transforming the Marina Bay area, the financial district, Sentosa Island and downtown areas through commercial and real estate projects, the building of two integrated resorts, the

introduction of Formula 1 racing, and the creation of a livelier entertainment and liberal arts scene. These attractions have added tremendously to Singapore's global reputation as a tourist destination and have earned billions of dollars for the Singapore economy.

Meanwhile, to nurture the "heartware" of society, Prime Minister Lee continued his promise of building an inclusive society in his second National Day rally speech in 2005, calling on everyone to play a part in remaking Singapore as a vibrant global city that can be proudly called home (Lee, 2005; Lim, 2005; Teo, 2005). The theme of Singapore becoming an inclusive society was again reiterated in Prime Minister Lee's third National Day rally speech in 2006 (The Straits Times, 2006) and through the years, the inclusive society rhetoric has become a salient keyword in Singapore's aspirational identity. In the search for new ways to co-create inclusive policies and build trust and engagement with diverse groups in society, the government launched national dialogs and conversations over the years, such as Singapore 21 (1999), Remaking Singapore (2002), SGfuture (2015) and the most recent, Our Singapore Conversation, with citizens across a diverse range of issues and policy areas (Ho, 2019).

Post-2004: developments in special needs education and disability

After the pivotal announcements of an inclusive society and better support for students with disabilities in mainstream education in 2004, the developments and directions in the fields of special needs education and disability that soon followed and which have continued to evolve progressively till the present, have been unparalleled in scope and outreach.

At the national societal level, the most comprehensive series of national roadmaps to have ever been developed in Singapore for persons with disabilities was first launched in 2007. These Enabling Masterplans offer a life-course approach to services in the disability sector with systematically drawn-up 5-year national roadmaps (known as Enabling Masterplans) to create an inclusive society where persons with disabilities can be supported and empowered to maximize their potential and be embraced as equal citizens. After its initial 5-year span (2007–2011), the first Enabling Masterplan was consecutively succeeded by the second Enabling Masterplan (2012–2016) and third (2017–2021) Enabling Masterplan. The next Enabling Masterplan (2022 - 2030) has a longer span for implementation compared with the previous Enabling Masterplans. In 2012, Singapore signed the United Nations Convention on the Rights of Persons with Disabilities (UNCRPD) and ratified it in 2013. The approach taken by Singapore, as stated in its 2016 UNCRPD report, point 19 on Article 24 (Education), is the life-course approach to services in the disability sector enacted through its series of Enabling Masterplans to inform the development of programs and services in order to progressively realize its vision of an inclusive society where people with disabilities are fully integrated and contributing members.

Within education, while there is no legislation mandating inclusive education pertaining to students with disabilities, increasing provisions and government funding as well as new policies to facilitate the greater inclusion and engagement with stakeholders and the community, have been key elements in the approach adopted since 2004 when Prime Minister Lee Hsien Loong shared the government's vision of an inclusive society—a theme which was reiterated in Singapore's 2020 Budget statements. With each decade since the call for an inclusive society by the government in 2004, the government has increased funding for education and support for people with disabilities; this is featured in government annual budgets. Currently, \$400 million per year is spent on initiatives for persons with disabilities and their caregivers while funding for special education schools by the government has increased by 40% since 2015 (Government of Singapore, 2019). In the past decade, the Ministry of Education (MOE) has committed \$150 million to the upgrading and building of special education schools to provide better facilities and meet rising demand for places (Disabled People Association, 2016).

In 2019, following up on its announcement in 2016 and after efforts on strengthening the structures and processes within the special education sector, the Compulsory Education Act which had been passed in 2000 was extended to include children with moderate to severe needs (Teng and Koh, 2017). The Act defines compulsory education as education in national primary schools for Singapore citizens residing in Singapore of compulsory school age (above 6 years old and under 15 years old). This amendment requires children with mild disabilities who have the cognitive abilities and adaptive skills to attend mainstream primary schools and children with moderate to severe disabilities to attend government funded special education schools (now recognized as "national primary schools") offering primary level education.

Initiatives and support for preschool children with disabilities

The post-2004 years have also seen a large expansion of funding, resources and services for young children of preschool age with disabilities. Children with developmental delays in Singapore are supported through the government-funded Early Intervention Program for Infants and Children (EIPIC) which provides social, learning and therapy services. Each child's progress is monitored through an Individual Education Plan, and intervention is conducted by a trans-disciplinary team of EIPIC teachers, therapists, psychologists and social workers. Since its commencement in 2003, the Government has expanded coverage and increased subsidies for children receiving such services.

The EIPIC has expanded from 9 centers offering 1350 places in 2006, to 17 centers in 2015, serving 2400 children and to 3200 places in 2018. In 2019, the Ministry of Social and Family Development (MSF) rolled out more customized early intervention services tailored to the varied developmental needs for children enrolled in the program at more affordable fees. The government is currently investing \$60 million a year in the program; a 30% increase from \$45 million in 2018 (Ministry of Social and Family

Development, 2020a). MSF is further exploring how to better integrate children with learning needs into pre-schools and also working with Singapore's Early Childhood Development Agency (ECDA), which oversees the early childhood sector, to take the early intervention programs under its aegis so that it can have better oversight of the developmental needs of all children under the age of seven and "strengthen the ecosystem of support" for these children (Teng, 2019a). It is envisaged that this centralization will aid parents in their search for support for their children.

Apart from the EIPIC, there has also been the development of the government-funded Integrated Childcare Program (ICCP). This is an inclusive program offered in mainstream childcare centers for children with mild to moderate disabilities ages 2–6 to prepare them for future entry into mainstream primary education. Its goal is to provide a natural learning environment for these children to socialize and learn with their peers without disabilities. In addition to this, there are the Development Support (DS) and Learning Support (LS) programs to support children with mild developmental needs to prepare them for entry into mainstream schooling. This involves helping children from EIPIC centers transition into a mainstream preschool setting through continued support and co-teaching with teachers in the preschool with the broader aim of equipping these children with the skills to function within a larger class setting.

Acknowledging that the quality of implementing the above initiatives to support the inclusion of young children with disabilities in preschool education depends ultimately on the quality of professionals involved, plans for strengthening the competencies of teachers within the early childhood sector are underway. In October 2020, the Minister for Social and Family Development, Mr. Masago Zulkifli, announced that ECDA would be developing a "Continuing Professional Development" (CPD) roadmap to guide the professional development of early childhood educators (Ministry of Social and Family Development, 2020b). The CPD will delineate the core competencies in priority areas and ECDA is also working with Singapore's National Institute of Early Childhood Development (NIEC) to increase the emphasis on inclusive practices at pre- and in-service training. The goal is to enhance educators' capacities in catering to the diversity of learning needs within their classrooms and develop more inclusive practices.

Current practice and support within mainstream schools and Institutes of Higher Learning

The current perspective that Singapore seems to have adopted is that of viewing the education system, with reference to students with disabilities, not as part of a dual system as in the pre-2004 era, but as one national system with a "continuum of services" emphasizing quality education in an appropriate school setting that can best serve their needs, either in a mainstream or government-funded special education school (Enabling Masterplan Steering Committee, 2016; Puthuchear, 2017). This was made clear in the definition of national primary schools in the Compulsory Education Act (Ministry of Education, 2020a).

Since the watershed year of 2004, the number of students with disabilities attending mainstream schools has risen considerably from 2500 students in 2005 (Chan, 2005) to 13,000 in 2013, to 24,000 in 2018 (Toh, 2018) and to 25,600 in 2019 (Choo, 2019). For a system of education that was traditionally dualistic in terms of the placement of students with and without disabilities into separate education systems, the exponential increase in the number of students with disabilities attending mainstream schools over those in special education schools has blurred the traditional boundaries and notions of special needs education associated with the pre-2004 era. Current statistics from the Ministry of Education (MOE) indicate that 80% of children with special educational needs are being served in mainstream schools while the remaining 20% requiring more specialized and individualized support attend one of Singapore's special education schools (Ang, 2020b).

Current forms of support for students with mild to moderate disabilities within mainstream schools include specialist support in the form of a cadre of personnel termed as "Allied Educators" (Learning & Behavioral Support) [AEDs (LBS)]; which was renamed as Special Educational Needs (SEN) Officers as of April 2022. This was introduced into mainstream schools in 2005 with the call for a more inclusive society and official support for the inclusion of students with disabilities within mainstream schools. The role of the AED (LBS) as delineated by Singapore's MOE is to support students with mild special educational needs such as dyslexia, attention deficit hyperactivity disorder (ADHD), mild Autism Spectrum Disorder (ASD), sensory and physical impairments in the form of individual or small group intervention or in-class support. There are reportedly 600 AEDs (LBS) serving in mainstream schools; the goal is to have two in each primary school and one in the secondary school (Teng, 2020).

In addition to the AED (LBS) support personnel scheme, 2005 also saw the proposal and implementation of a systemic plan to train a core group of mainstream primary and secondary school teachers known as "Teachers trained in Special Needs" (TSNs) to provide learning support as well as to help build the capacity of the teachers in their schools in working with students with diverse needs. The goal then was to have 10% of teachers in all primary schools and 20% in all secondary schools take the Certificate in Special Needs so that the knowledge and skills acquired by these teachers would cascade through the system. In addition to this, in pre-service programs at the National Institute of Education (Singapore's sole teacher education certification body), beginning teachers were equipped with basic understanding of how to cater to students with disabilities.

To provide further help in the early years of schooling to students experiencing learning difficulties, there is the Learning Support Program for primary school learners who require additional aid with English Language in the initial two years in school (Primary 1 and 2) and the School-based Dyslexia Remediation (SDR) program for students in their third and fourth year in primary school (Primary 3 and 4) assessed to have dyslexia. The SDR program is conducted by trained school personnel using a MOE-designed curriculum. Students with dyslexia beyond Primary 4 would attend the Main Literacy Program conducted by the Dyslexia Association of Singapore (DAS).

Although the current framework in terms of educational placements in Singapore still recommends that mainstream school settings would be more suited to students with disabilities who are able to access and cope with the mainstream curriculum with support and those with higher support needs who require more intensive specialized support would be more appropriately served in special schools, there is acknowledgment that Singapore's landscape is evolving, and that these placements and provisions will change over time (Ministry of Education, 2018). For example, within the mainstream education system, the paradigm and approach to support students with disabilities have changed with the building of the systemic capacity of mainstream schools to take ownership and responsibility in this area through initiatives such as the training of mainstream teachers as TSNs, the specialist support in the form of the AED LBS, implementation of the school-based remediation programs and provision of support services from providers of psychological services and social service agencies as well as the coaching provided by the Psychological Services Branch, MOE.

This incremental capability enhancement toward a whole-school systemic response for supporting students with special needs in mainstream schools since 2005 prepared the ground for the recent introduction of a more comprehensive framework of support by MOE to all mainstream schools known as the "Tiered-System of Support for Special Educational Needs" (TSS). This framework is similar to the multi-tiered model of Response to Intervention (RTI) where intensity of support provided is matched to the severity of a student's learning and/or behavioral issues (Aljunied, 2021; Dutt et al., 2019).

Within each school, a "Case Management Team" (CMT) oversees the support of students with special needs and implementation of the recommended interventions. Psychologists from the Psychological Service Branch monitor and build the capabilities of the CMTs through regular meetings and training sessions.

This move toward a tiered system of support within mainstream schools represents a significant step toward inclusive education because it proactively seeks to identify and provide intervention for all students who are at risk due to learning and/or behavioral difficulties not just those with special educational needs. In addition, this tiered system of support will require the collaboration and teamwork of relevant staff members to coordinate efforts in order to sufficiently address the learning and behavioral needs of at-risk students who may require more intensive interventions with multiple supports and services.

One corner in the strengthening of the capability of the mainstream education system in supporting the inclusion of increasing numbers of students with disabilities over the past fifteen years, has been the attention devoted to the professional development of educators. Since 2004, there has been increased focus on professional development in the area of special needs education within mainstream teacher education, the early childhood sector and Institutes of Higher Learning. Within the Institutes of Higher Learning, as of 2015, more than 1500 staff from the polytechnics and Institutes of Technical Education (ITE) have undergone professional development courses in special needs; the goal is to have all staff in the polytechnics and ITE gain knowledge and skills to cater to a more diverse student population (Disabled People Association, 2016).

In March 2020, a significant milestone was reached. MOE unveiled a professional development roadmap to ensure that all mainstream educators would gain basic knowledge and skills in the area of special educational needs to help them better support students with disabilities in mainstream settings. This roadmap is part of the SkillsFuture for Educators (SFEd) initiative and delineates core competencies which all mainstream teachers are expected to attain at pre-service ("emergent" level) and in-service ("proficient" level) through bite-sized online learning and professional development workshops (Ang, 2020a; Ministry of Education, 2020b,c).

Besides building the capability of the mainstream education system to support and practice inclusion, MOE initiated collaborative partnerships between mainstream schools and special schools to facilitate greater interaction and more inclusive attitudes among students from both types of schools through the Satellite Partnership Program in 2008, starting with two special education schools and three mainstream schools. The schools that participate in the program are generally located near each other. This program creates opportunities for students from both schools to mingle through co-curricular activities, games and community projects. Students with disabilities deemed academically ready can also join their peers in the mainstream school for academic subjects. Through this partnership, collaborations, exchanges of ideas and inclusive practices have also been facilitated between teachers from the schools. Benefits have been reported in the deepening of understanding and greater acceptance of people with disabilities on the part of mainstream students and learning of social skills and increased confidence in terms of interactions on the part of students from the special education schools (Teng, 2019b). Currently, 16 of the 19 special education schools are in these partnerships; the goal is to have all 19 in the program.

Inclusive education as a catalyst for reform

In spite of all the developments that have occurred since 2004 to promote the inclusion of persons with disabilities, it will take more time and effort for Singapore society to build the "heartware" to be more inclusive of persons of disabilities. While the focus of the provisions and initiatives seem to be on adequate provisions and accommodations for learning needs in order to pave the way for progress, especially in terms of "hardware," there is growing acknowledgment since 2016 of the need to work on the "heartware" of Singapore society and to intentionally design opportunities for social interaction to educate and develop more inclusive attitudes within the larger community. This resolve to work harder on the aspect of social inclusion gained impetus from the findings of two surveys in 2016, one commissioned by the Lien Foundation and the other by the National Council of Social Service (NCSS).

The findings from the surveys revealed that the majority of Singaporeans felt that Singapore was not an inclusive society, and while willing to share public spaces, preferred not to interact with people with disabilities. They were also not confident interacting with children with disabilities and were not comfortable being close friends with persons with disabilities. The majority of people with disabilities who participated in the NCSS survey stated that they did not feel socially included, accepted or given opportunities to achieve their potential.

The Lien Foundation (2016) survey findings also indicated that only one in four parents reported that their children were friends with children with disabilities and that the primary barrier was the lack of conducive opportunities. The NCSS survey findings revealed that Singaporeans felt and behaved more positively toward persons with physical or sensory impairment than those with intellectual disability or ASD, and that attitudes toward people with disabilities were more positive with greater contact (National Council of Social Service, 2017).

Within the education sector, existing research studies conducted with mainstream Singaporean teachers on their attitudes toward and experiences with students with disabilities reveal neutral to negative responses. Poon et al.'s (2016) survey of 131 teachers and school professionals from two mainstream secondary schools reported an overall neutral attitude toward the inclusion of students with disabilities. Thaver and Lim's (2014) survey of 1538 preservice mainstream teachers reported generally negative attitudes toward people with disabilities, ambivalence toward the inclusion of students with disabilities and a preference for special school placements for students with disabilities. Both positive and negative experiences related to the inclusion of students with disabilities were reported in Yeo et al.'s (2016) research study. In their focus group interviews with 202 teachers across 41 primary mainstream schools, the teachers indicated more negative than positive experiences. Positive experiences included satisfaction with students' progress and new learning for teachers while stress from dealing with challenging behaviors and instructional difficulties in attempting to meet the diverse needs of the class comprised dominant negative experiences.

In light of these attitudinal findings which, per se, constitute barriers to the inclusion of persons with disabilities in education and society, we believe that inclusive education is all the more relevant and important to the inclusion discourse as well as future directions for the fields of special needs education and disability in Singapore. In a country like Singapore which is intentionally seeking to become more inclusive through education, inclusive education provides a critical spotlight on identifying and dismantling educational exclusion and marginalization, poses questions about the power relations of schooling, confronts injustice, and re-envisions education as a democratic apprenticeship to build inclusive and sustainable communities (Slee, 2011).

Inclusive education can offer an "insurrectional edge" to interrogating the foundations and assumptions of educational policy and practice (Slee, 2008) as well as institutional structures, social policies and cultural mindsets in Singapore that have contributed to prevailing public attitudes toward persons with disabilities. As such, inclusive education can identify and highlight areas of education, concerning not just students with disabilities but all students across mainstream and special education, that are in need of reform because of effects that can compromise the holism and outcomes of their education. Hence, inclusive education, as an element of a broader reform for the architecture of schooling (Slee, 2008), can be a catalyst for reforming schooling in Singapore to be more inclusive.

Conclusion

It is unequivocal that the most progressive developments in the fields of special needs education and disability ever witnessed in Singapore have occurred over the past eighteen years after the envisioning of an inclusive society in 2004. What is particularly encouraging about the thrust of many of these developments is the increasing realization and emphasis that the improvement of the quality of life of persons with disabilities needs to be contextualized in their inclusion within communities and society; and therefore, communities, including school communities, and society need to change in order to become more inclusive of people with disabilities. In hindsight, this change in priority and direction to intentionally open up the inclusionary space within mainstream communities and society for persons with disabilities was circumscribed within a larger nation building agenda to reimagine and remake Singapore for the 21st century.

The pragmatic significance of these national directions, developments and events is clear: as one of the freest economies in the world that is deeply interconnected with the global economy, Singapore's survival and success rest on its pragmatic usefulness and relevance to other countries, and therefore staying ahead of other countries in a highly competitive and volatile global economic climate while remaining a livable, stable and peaceful home for its citizens, is crucial to sustaining Singapore's survival and success (Lim and Thaver, 2021). Therefore, the impetus and response toward inclusion for persons with disabilities can be interpreted as a default to the larger nation building scheme of transforming Singapore for reaping the benefits and addressing the challenges of an increasingly globalized and competitive world.

Singapore's brand of inclusiveness for diversity is sensibly steeped in the practical foundational benefits of its collective nation-building efforts to be stable, peaceful and prosperous. This pragmatic ethos to inclusion provides a contrast to the right-based based approach prevalent in the brand of inclusive education dominant in many Western countries.

In the chronological evolution of Singapore's shift toward the inclusion of persons with disabilities in society, their growing inclusion within mainstream society did not hinge upon them exercising their individual rights to challenge infringements upon their human rights to access and participate in mainstream environments. Instead, their inclusion is couched as a counterpart of a collective long-term aspirational response to the envisioning of Singapore as an inclusive society. What has facilitated and sustained the inclusion movement and its developments in Singapore as a priority in education and society are the alliances that

have been re-invigorated between the inclusion of more vulnerable individuals (such as the elderly and the disabled) and the re-envisioning and re-invention of Singapore for the 21st century (Lim et al., 2019).

Singapore's ratification of the UNCPRD in 2013 means that the role of inclusive education must be strengthened across both mainstream and special education through the challenge of identifying educational policy and practice that act as barriers to inclusion and confronting forms of educational settlements that contribute to exclusionary attitudes. Since the UNCPRD affirms the rights of students to access and participate in an inclusive education, the motivations, aspirations and means for translating the envisioning of an inclusive society will need to be increasingly framed within a right-based perspective and discourse. How inclusive education will evolve in Singapore, and how inclusive education will evolve Singapore into the future, remains to be seen.

Introduction

This article considers disability history in relation to the field of education and the emerging welfare states in Sweden, Norway and Denmark. The Nordic countries resemble each other in many ways (Telhaug et al., 2006). The reasons for the great similarity between these countries are geographical, historical, cultural, linguistic and political. The connections between these three countries have traditionally been very close, not least in the fields of education and science. The object of this article is the historical relationship between education, disability/mental disorders and the welfare state in Sweden, Norway and Denmark. Historically, education as a field relates to the development of schooling, and education as a science is associated with teaching, educational systems and upbringing (Popkewitz and Lindblad, 2004; Tröhler, 2020). Education, in this context, concerns how educational ideas transform into practices in education and schooling.

Our way of understanding the history of disability and mental disorders relates to Michel Foucault's explanation of the interaction between technologies of discipline and security in the development of modern states (Foucault, 2009). Educational science and educational practices function as disciplining technologies in the shaping of norms for the upcoming generations, the schooling system and the future society. From this perspective, disability and mental disorders represent disturbing phenomena. Since the era of the Enlightenment, societies have developed technologies of security, that is, institutions and practices. According to Foucault, the institutions in modern states develop between technologies of discipline and securitization (Foucault, 2009).

In light of this, the history of disability and mental disorders concerns the history of the parallel processes of, on the one hand, excluding and, on the other hand, integrating people with disabilities and mental disorders into the modern liberal welfare state. Civil rights, inclusiveness and social security are often associated with the welfare state. Mitchell Dean questioned these ideals, stressing that liberal states have developed some very illiberal practices toward its unfit members (Dean, 2010), for example eugenic legislation and the establishment of island institutions for people who were regarded as "feeble-minded."

To understand the history of disability, we must question how differentiations have been constructed through history (Stiker, 1997). Studying disability is thus about determining how the differentiation of disabilities has been organized and legitimized through discourses, institutions and practices and the rationality behind the differentiation. According to Stiker, even more important in these processes is the question of integration: "Why does society try to integrate the disabled? What is behind the intention? And, more precisely, why does society want to integrate in the way it does?" (Stiker, 1997, 15). The study of the history of disability and mental disorders is about investigating *how* these processes take place. Institutional settings and the incarceration of people with disabilities are expressions of a certain political rationality that has been applied in Western countries for centuries (Ben-Moshe et al., 2014). Alternatively, as disability scholar Bill Hughes (2020, 5) put it, "Examining the past for strands that tell stories of disability leads to the contention that disability history is a history of dis/ability. It cannot escape its umbilical connection to the history of the relations between disability and non-disability." Ability and disability are intertwined phenomena, and approaching disability history could thus be summarized as examining the changes in disability through changing ideas, discourses, institutions and practices.

These remarks hint at our point of departure. The history of disability and mental disorders since the era of the Enlightenment has been a history of how to govern disability through ideas, institutions, practices and professionals. Our focus is on psychiatric asylums, institutions for disabled people and special needs education. On the one hand, these phenomena are entangled and follow similar lines; on the other hand, they developed in very different ways, with their own ideas, institutions and practices. The period of study is 1800 onward, with a focus on 1900–1950. Firstly, we briefly outline some historical trends in the development of the three

Scandinavian countries that influenced the three practices for psychiatric institutions, institutions for disabled people and special needs education in the schooling system. Subsequently, we investigate the practices in three separate sections. These sections draw lines between the early developments, ending up in the current debates on the deinstitutionalization process and inclusion. In the conclusion, we ask what characterizes the differentiation of people with disabilities and mental disorders in the three Scandinavian countries with regard to the three practices.

General historical patterns—disability and mental disorders

Before the 19th century, people with disabilities were not defined as a specific group, and historical records of the time contain sparse information about them (Rønn, 1996, 69–86; Grunewald, 2009, 27–42). However, medieval sources occasionally mention people, described as mad or foolish, who were incarcerated (Goodey, 2011). Until the Enlightenment in the 18th century, disability and mental disorders were considered as natural, demonic or divine. The philosophers of the Enlightenment believed in the importance of education and pedagogy and the moral shaping of the human character (Froestad, 1995, 78–79). Departing from religious beliefs, the Enlightenment thinkers believed in knowledge and reason. Following this line of thought, the poor and people with disabilities were regarded as potential resources for the society (Froestad, 1995). Institutional changes regarding hospitals and asylums for mental disorders also reflected this philosophy. The foundation of the first disability institutions relied on the idea of the period that humans were formable. This change of view was part of the scientific and ideological modernization, including new space for experiments in the field of disability care, education and policy. Ideas took shape through medical development but also in education and the way in which educational institutions for disabled people emerged in Scandinavia. These processes in the three countries were part of a general process of rationalization and modernization.

The development in the countries was a move from private, religious and philanthropic initiatives toward a higher degree of state involvement. This was the case in terms of the social policy, the organization of institutions as well as the establishment of the schooling system. Philanthropy played a significant role in the policy handling the problem of the poor in the last part of the 19th century, that is, the social question. The increasing effects of the industrialization and the market led to greater awareness about children's problems. Norway and Denmark adopted comprehensive child protection acts in 1896 and 1905 (Christiansen and Markkola, 2006, 15). On the threshold of the 20th century, the Scandinavian states passed reforms to handle phenomena such as social security, old age, illness and unemployment. In these processes, the social democrats in the Nordic countries played a major role in promoting social policies, paving the way to the establishment of the welfare state. The social democratic parties managed to obtain a very strong position in the three countries by virtue of their engagement in social rights. In the 1930s, they profiled themselves as parties for the people, which is apparent in the slogans *Folkheim* in Sweden and *Danmark/Norge for folket* (Denmark/Norway for the people) (Korsgaard, 2008). The social democratic parties succeeded in building alliances across parties in the adoption of vast social reforms in the 1930s. The visions and ideas took shape in collaboration with experts such as sociologists, economists and social scientists. Some of the most prominent of these experts were Gunnar and Alva Myrdal, who contributed to the social, political and economic theory of the time (Christiansen and Markkola, 2006, 20). During the interwar years, when the social democrats were in power, eugenic acts were introduced in the Scandinavian countries (Have, 2000; Koch, 2000; Tydén, 2002; Christiansen and Markkola, 2006). The Scandinavian development combined the early development of social democratic parties with the adoption of social rights, with similar early reliance on eugenics as an idea and practice.

Psychiatry from 1800 to the 1970s

The earliest method of isolating the insane made use of a type of wooden cage with thick walls of heavy timber and an iron door with a hatch through which food was passed. Most of these cages were in the hospitals that would later evolve into psychiatric units. The largest collection was at St. Hans Hospital, situated outside of the Copenhagen ramparts in the early 17th century. Later, in 1816, the doctor Johannes Seidelin was appointed as consultant at St. Hans, and the hospital evolved into a psychiatric hospital (Zalewski, 2008; Hamre, 2010; Kragh and Møllerhøj, 2016).

The living conditions of the so-called insane generated little concern, however, until the early 19th century, when Scandinavian physicians raised the alarm. Danish medical doctor Jens Rasmussen Hübertz traveled the country in the 1840s, and he was shocked to see how the insane lived (Hübertz, 1843). In private homes, both rural and urban, he often found people who were chained or bound with rope or who had spent years in wooden crates or confined spaces. Hübertz, in 1843, proposed the building of three big psychiatric hospitals as well as an institution or asylum for the so-called feeble-minded. Similar initiatives were undertaken by the Norwegian doctor Herman Wedel Major (Haave, 2008; Kringlen, 2012). In Sweden, such plans had already been carried out in the 1820s (Qvarsell, 1982; Eriksson, 1989).

In 1848, Norway was the first of the three Scandinavian countries to pass an Insanity Act (Dahl, 2018a; Skålevåg, 2016). Sweden followed suit in 1858, whereas Denmark's first psychiatric law was passed as late as 1938 (Adserballe, 1977; Wetterberg, 2012). In all the Scandinavian countries, the state had a major role in establishing the mental health service. Three large psychiatric hospitals or state asylums were built in Norway during the period 1855 to 1881. Similar Danish state mental hospitals were founded in the late 19th century, and very large hospitals, such as Becomberga Hospital in Stockholm, opened in Sweden (Sjöström, 1992; Jönsson, 1998; Eivergaard, 2003). Besides state asylums, county psychiatric hospitals, municipal hospitals and university clinics were

established during the late 19th and the early 20th century. In the early 1950s, Danish hospital psychiatry had evolved into a comprehensive system with almost 11,000 psychiatric beds. By that time, the Danish population had reached almost 4.3 million (Kragh, 2008, 2010a,b,c). In Sweden, with a population of about 7 million people, psychiatric hospitals had beds for more than 26,000 patients in the same period, and, in Norway, with the smallest population of approximately 3.3 million, psychiatric institutions provided beds for approximately 7000 inmates (Haave, 2008, 257; Berg, 2018, 61).

When the first Scandinavian asylums opened in the early 19th century, medical doctors were appointed as managers or consultants of the hospitals. In the years that followed, the medical profession gained a strong hold over the mental health care system. The profession's representatives also acquired certain recognition in other areas. With the establishment of highly secure detention institutions designed for the most dangerous "mentally ill criminals," psychiatry was involved in the politico-legal area to an increasing extent, and this position solidified further in the 1930s (Börjesson, 1994; Garpenhag, 2012; Bergheim, 2014; Nilsson and Vallström, 2016; Skålevåg, 2016; Dahl, 2018a,b; Kragh, 2018). The first Scandinavian criminal asylum, Kriminalasylet, opened in the city of Trondheim in Norway in 1894. This institution was deemed necessary to protect society from so-called criminal, dangerous or disruptive male psychiatric patients. The Norwegian Criminal Act of 1842 prohibited the punishment of the insane, and, consequently, such offenders could not be imprisoned (Myhre, 2016; Dahl, 2018a,b; Rabben, 2020). The Trondheim criminal asylum was seen as the solution to this problem. In 1910, a Danish state commission presented plans for a high-security ward, which would have 50 beds and would be not only for "insane criminals" and dangerous psychiatric patients but also for "the feeble-minded," "psychopaths," "epileptics," and "alcoholics" (Kragh, 2018). In Sweden, wards for criminals with mental disorders had been set up in the prison system in Norrköping and Ystad, and, after a Swedish act on high-security wards was passed in 1937, a new institution also opened in Hall (Bergheim, 2014; Nilsson and Vallström, 2016).

Patients with psychiatric disorders were to some extent considered a threat or a burden to society in the Scandinavian countries in the 20th century. During the 1940s and 1950s, euthanasia of people with mental disabilities became a heated topic, and the issue was discussed in the Scandinavian countries (Kragh, 2019). In Norway, actual plans to kill a large number of patients in mental hospitals were put forward by the politician Christopher Lange in 1944. Lange's suggestion was considered by the Norwegian Ministry of the Interior, but it finally found the proposal to be too problematic (Haave, 2008, 237–244). At the end of World War II, many patients with psychiatric disorders from the northern regions of Norway were deported by the Germans, but there were no signs of attempts to exterminate the patients during wartime (Fause, 2015). In Sweden, too, euthanasia was discussed (Barow, 2009, 276–280). During a debate in the Swedish Parliament, the later Minister of Culture Arthur Engberg gave a talk about the "feeble-minded." He supposed that "we perhaps in the not-so-distant future are forced to consider wiping out such lives" (Barow, 2009, 277). The famous Swedish feminist writer Ellen Key also left the door open to euthanasia (Tyden, 2010, 366), but the idea did not become reality (Engwall, 2005; Seeman, 2006). In Denmark, public debates took place in 1949 and 1950. Plans about euthanasia for people with psychiatric disorders and intellectual disabilities were proposed in this period, but these were not finalized (Kragh, 2019). As historian Thomas Barow noted in the case of Sweden, the development shows that no radical political system was necessary to put people with mental disabilities in threatening situations. The extent of coercion that the Swedish state could exert over individuals was huge, but in no way did it match the power of the German national socialism. Such differences highlight the limits of conformity between the two countries (Barow, 2009, 397).

In 1913, the first Nordic Psychiatric Congress took place in Copenhagen. After this event, Nordic congresses were organized regularly every third year. The Nordic Psychiatric Association was founded in 1935 (Knorrung, 2012). Therapeutic innovations, especially somatic treatments, were discussed at the Nordic congresses. In the early 1920s, malaria fever therapy was introduced for patients with the diagnosis dementia paralytica (Kragh, 2010a), and, at the Nordic congress in Oslo in 1938, shock treatments and insulin coma therapy were presented (Kragh, 2010b). At the congress in Copenhagen in 1946, lobotomy played a major role. Lobotomy, invented in 1935 by Professor of Neurology Egas Moniz in Lisbon (Valenstein, 1986), was warmly embraced by Scandinavian psychiatrists. The first operations were performed in Denmark in 1939 (Kragh, 2010c, 2021). The psychiatrist Ørnulf Ødegaard and the surgeon Arne Thorkildsen conducted the first Norwegian surgical intervention at the Gaustad psychiatric hospital in Oslo in 1941 (Tranøy and Blomberg, 2005). Psychosurgery came to Sweden a little later—the first lobotomy was performed in 1944 (Ögren, 2005). The Scandinavian countries command a special position in the worldwide context when it comes to lobotomy. More than 2500 operations were performed in Norway and approximately 4400 in Sweden. In Denmark, at least 4500 psychosurgical interventions took place on Danish neurosurgical wards from 1939 to 1983. With a population of only 4 million Danes in 1945, this is an extremely high number. In fact, no other country in the world has equivalently high figures in relation to its population size (Kragh, 2010c, 23–24).

After the introduction of anti-psychotic medication and anti-depressants around the mid-1950s (Swazey, 1974; Healy, 1997, 2002; Gelman, 1999; Valenstein, 2001; Shorter, 2008), the use of psychosurgery declined but did not disappear. The last operations were performed in Norway in 1974 (Tranøy and Blomberg, 2005, 108) and in Denmark in 1983 (Kragh, 2010c). In Sweden, however, precision psychosurgery (capsulotomy) was still undertaken until 2007. More than 200 Swedish patients received psychosurgery in the period from 1970 to 2007 (Bejerot, 2004; Rörbecker, 2010).

Patients selected for lobotomy often had long-term hospital stays. A very large group found itself trapped in the psychiatric system, spending lengthy periods in hospital, and the bed-blocking problem only seemed to grow despite a higher number of discharges at the time. In 1937, 34.6% of all Danish patients had been in hospital for more than a decade. By 1947, the figure was 49.7%, and, by 1952, it had risen to 51.3% (Betænkning, 1956, 148). Similar patterns of hospital stays could be found in Sweden and Norway. However, during the 1960s, hospitalization patterns began to change. Around the mid-1950s, antipsychotic drugs, such as chlorpromazine (Thorazine/Largactil), made their way into Scandinavian psychiatry. The early trials carried out at the

hospitals raised hopes that chlorpromazine and other drugs could improve patients' conditions since they seemed to be effective against a number of classic psychotic symptoms. The hospitals reported that patients were generally calmer and were up and about more on the wards or outside.

Doubts were later raised about whether the drugs would actually improve the hospitals' capacity problems. The initial reports did not suggest a marked change in the turnover of patients. More patients could be treated more quickly, but the trend had little effect on the large group of patients who spent many years in hospital. As the Danish psychiatrist Erik Strömberg noted in a cross-sectional survey of all the hospitals in 1957, "there was no sign that the therapeutic progress had caused any radical change in the overall picture." It was not until a later review in 1962 that he noted that a large group of long-term patients could be discharged and could cope with life outside the hospitals. Psychotropic drugs were part of the reason for this new situation, but, as Strömberg explained, other factors also played a part: "The explanation is in all probability that the rehabilitation measures necessary to maintain the results of pharmacotherapy and to improve on them, were not felt until sometime later. The impact of the introduction of the state pension on this must also be stressed" (Strömberg, 1965). The patients' opportunities to cope with life outside hospitals were limited prior to the introduction of the state pension in 1957. Before then, they had to make do with a disability pension, which was not enough to live on outside of hospital. The state pension was followed a few years later by other initiatives, such as rehabilitation acts and disability pensions. However, the change in hospitalization patterns did not lead to the downsizing of the hospitals in the 1960s. On the contrary, the number of beds was higher than ever before at many of the Scandinavian psychiatric hospitals in the early 1970s (Sjöström, 1992; Haave, 2008, 433ff; Kragh, 2010c). The downsizing of the hospitals began in the mid-1970s. New ideas of community care, critique of the "total institutions," patients' movements and political considerations all played a role in this process.

Disability institutions from 1800 to the 1970s

Froestad (1995) has made a historical analysis of developments within disability institutions and special education in the Scandinavian countries in the 19th century. In the period 1840–1890, the education of people with disabilities expanded internationally as well as in the Nordic countries. Nordic meetings and journals emerged in this period to share knowledge on deaf-dumbness, blindness, feeble-mindedness and other disabilities. In 1872 onward, Nordic meetings were established on what was entitled *Abnormsagen*, which could be translated into English as the question of the abnormal, referring to people who deviated from what was perceived as normal. In the proceeding meetings, the key issue was the organization of the care and upbringing of disabled people. Professionally, as well as politically, these meetings came to play an important role. The sharing of ideas among experts and the development of new pedagogies were the result. The meetings also addressed important questions of education, especially for the blind, the deaf-mute and the feeble-minded.

As noted by Froestad and Kirkebak, the education of the deaf-mute and the blind had the highest status because of the strong involvement of experts in the field and the promising possibilities for integrating these groups into society; at the bottom were people who were perceived as feeble-minded (Froestad, 1995; Kirkebak, 1993). In the organization of the care, there were important national differences. The care of the so-called feeble-minded was conceived as a pedagogical question in Norway, as a medical one in Denmark and as a religious-philanthropic one in Sweden. Froestad argued that a similar situation applied to the education of the deaf and those perceived as feeble-minded (Froestad, 1995, 333).

By the mid-19th century, large institutions for the "feeble-minded" began to emerge. In Denmark, the establishment of these institutions in the 1850s and 1860s ran parallel to the creation of hospitals or asylums for patients with psychiatric disorders (Kirkebak, 1993; Kragh, 2008). During the late 19th century and the early 20th century, a number of large institutions, managed by medical doctors, were created in various parts of Denmark. These institutions were originally founded on a philanthropic basis but received financial support from the state (Kirkebak, 1993, 150–153).

There were, of course, differences between the three countries. The early industrialization in Denmark, for example, meant that tasks such as handling deviancy became part of social policy. Enrollment in and stays at a disability institution were increasingly supported by the public sector. In all three countries, the care for the feeble-minded may be regarded as a prism reflecting the way in which disability care was handled (Froestad, 1995). Differences between the groups were obvious. Whereas doctors had the dominant position in Denmark, Swedish disability care was still influenced by tradition and religious and philanthropic values. Generally, "it can be argued that disability care in Sweden in the latter part of the last century [19th century] was defined as poverty policy, in Norway as school policy, and in Denmark as social policy" (Froestad, 1995, 428, our translation).

Views on feeble-mindedness were influenced by the central role that ideas of degeneration played in the Scandinavian countries. These took shape from international ideas like the French psychiatrist Bénédict Augustin Morel's theory of degeneration in 1857, the scientist Charles Darwin's theory of evolution in 1859 and Gregor Mendel's laws of inheritance but primarily the British psychologist Francis Galton's theory of eugenics.

Informed by the ideas of eugenics, Denmark was the first country to establish legislation on sterilization. In 1924, the Danish Minister of Justice, K. K. Steincke, set up a commission to investigate options for sterilization and castration (Koch, 1996, 56). Two years later, the commission issued a report recommending that the so-called "feeble-minded," "mentally ill patients" and people over 21 years of age with an abnormal sex drive should be permitted to undergo castration or sterilization. Only a small number of physicians found the suggestion to be unacceptable. A few legal professionals also held a critical stance toward sterilization and castration, but most politicians were in favor of the idea. In 1929, a sterilization and castration act was passed by the Danish

Parliament—the first in any European nation (Graugaard, 1997, 127; Koch, 2000, 344). A further act allowing compulsory sterilization and castration of “the feeble-minded” and other groups was passed in 1934 and 1935 (Koch, 1996, 2000, 193–194). Similar acts were passed in Norway in 1934 (adjusted law under the Nazi occupation in 1943–1945) and in Sweden in 1934 and 1941. As in the Danish case, Norway and Sweden adopted the sterilization laws with a broad political majority in their parliaments (Koch, 2006, 304). The numbers of sterilizations in the three countries were approximately 11,000 in Denmark (1929–1960), ca. 17,500 in Sweden (1935–1960) and around 7000 in Norway (1934–1960) (Roll-Hansen, 2006, 263; Tyden, 2010, 375). These numbers are those that can be directly related to the laws; the actual numbers of sterilizations were higher.

To exclude people who were perceived as feeble-minded and dangerous to society, the Danish state organized two island institutions, Livø for men and Sprogø for women (Kirkebak, 1997, 2004). The initiatives were seen as progressive in that time. In the period 1911–1962, approximately 700 men were interned in Livø. These were men who were perceived as slightly mentally weak and able to work and who had been detained for disciplinary reasons or because they had committed offenses. The men’s behavior was interpreted from the eugenic mindset, and the island was considered to be a crucial prevention technology. Similarly, Sprogø, an island for women who were perceived as feeble-minded and frivolous, functioned in the period 1923–1961. Sprogø housed 500 women.

During the early 20th century, the Danish state took more control of the service for vulnerable groups. When the National Assistance Act was passed in 1933, institutional care for the treatment and education of the “feeble-minded” became the responsibility of the state, which was obliged to cover all the expenses for the care of people with physical or mental disabilities (Merrick et al., 2014; Kragh et al., 2015). This involvement by the state reached a new level with the establishment of the Mental Retardation Service under the jurisdiction of the Ministry of Social Affairs in 1959, when all the existing institutions were taken over by the state. At that time, there were about 7500 beds at these institutions. The largest one, in Brejning, which was founded in 1899, had more than 1700 beds (Duedahl, 2019). The Danish hospital-like institutions served as a model for those in Sweden and Norway, where only a few residential facilities had been developed in the 19th century (Grunewald, 2009, 51, 365; Fjermeros, 2009, 177, 261). In Sweden, no more than 380 beds were registered in the asylums (“vårdhem”) in 1910 (Grunewald, 2009, 367). At the time, most Swedish children and adults with disabilities were placed in boarding schools, workhouses or family care. A similar situation existed in Norway, where only two institutions opened in the 1890s. In 1945, a total of 480 beds were registered at Norwegian disability institutions. Due to the lack of beds, more than 500 people with intellectual disabilities were housed in psychiatric hospitals, and over 1000 were in family care (Fjermeros, 2009, 180). However, in the 1950s, Sweden followed the same model as Denmark and began to develop a system of large institutions. The expansion of the disability care system was part of the development of the Swedish welfare state. The period from the 1950s to the late 1970s is often thought of as the golden years of the Swedish welfare state. Universal income-related social security was established as well as ambitious labor market policies and the expansion of health care and personal social services in the counties and local municipalities (Lindqvist, 2017, 218–219). This also included plans to modernize and upsize the institutional system for people with disabilities. During the period 1960–1970, the number of beds in large disability institutions grew from 5500 to 10,500 (Grunewald, 2009, 367). In Norway, an increase in the number of beds also took place from about 2000 in 1955 to 6550 in 1970. However, half of these beds were situated in homes, small institutions and family care (Fjermeros, 2009, 305). These numbers were rather small compared with those for Sweden and Denmark. In Denmark, with a slightly larger population, approximately 10,000 people were placed in residential institutional care and about 12,000 in family care, small institutions and so on (Fjermeros, 2009, 305–306; Kragh et al., 2015, 260–261).

Despite the Scandinavian preference for large institutions in the 20th century, opposing thoughts about disability care surfaced during this period. Public critique of institutional care became more frequent after 1945, when ideas of human rights emerged. The European Council’s Convention on Fundamental Human Rights (1948) was ratified by the Scandinavian countries in the 1950s, and the rights of people with disabilities subsequently began to be a public issue. Equally important was the emergence of the first parent associations in Scandinavia. In 1952, the Danish association LEV [Danish Society for the Welfare of the Intellectually Disabled] was founded, and, in 1956, the Swedish parent association “Föreningen för utvecklingsstörda barn” [FUB] (Swedish Association for Children, Youths and Adults with Developmental Disorders) was established (Kirkebak, 2001; Grunewald, 2009, 215). Similar associations emerged in Norway in the mid-1960s. These new associations would play a key role in the fight for political and administrative reforms for disabled people.

In 1946, the concept of normalization was used for the first time in Sweden by the Commission for People with Partial Work Ability. The commission’s task was to investigate and propose measures to make better use of the work ability of the partially disabled so that they could obtain or keep gainful employment (Hollander, 1999; Lindqvist, 2017, 219). This idea about normalization would be developed further in Denmark by a commission that was set up in 1954 to reform the services for the so-called feeble-minded (Kirkebak, 2001). With the Danish Act No. 192 of June 5, 1959, the normalization principle was introduced in practice. This act granted power to the Danish National Service for the Feeble-minded to provide people with learning disabilities with living conditions as close to those of others in society as possible (Kirkebak, 2001). Self-determination for people with disabilities also became an important issue. In Sweden, a new disability act was implemented in 1967. By the late 1960s, the normalization principle gained further ground through the work of physician Bengt Nirje (Hollander, 1999; Perrin, 1999; Grunewald, 2009, 219–220). In the same period, the normalization principle also held a strong position in Norway (Kristiansen, 1999, 397–398). This would later lead to a showdown with the exclusive laws for people with disabilities and the large disability institutions.

New perspectives: empowerment, patients' voices and critique after 1970

During the late 1960s, a medical counterculture began to emerge, in which medical science and its practitioners came under increasing scrutiny. The counterculture that emerged from the youth movements of the day also brought with it a critical reappraisal of the role of medical science in the treatment of groups that deviate from society's norms. Scandinavian left-wing intellectuals wrote several articles on psychiatry, inspired by international thinkers such as Ronald D. Laing and David Cooper and their notion of "anti-psychiatry" (Crossley, 2005; Jacobsen and Larsen, 2007, 444–445; Haave, 2008, 396–397; Ohlsson, 2008).

However, this critical focus on the conditions faced by people with mental disorders or intellectual disabilities and other groups of people who were placed under state care was not only a consequence of the late 1960s youth counterculture. Within psychiatry, alternative approaches had already been emerging, like Maxwell Jones's therapeutic communities and other currents that prioritized social–psychiatric and psychological theories of mental disorder (Whiteley, 2004; Haave, 2008, 375–379, 493–494; Kritsotaki et al., 2019). The legislation covering this area in the late 1950s represented the start of a period of major reform, and the idea of normalization became further entrenched in the following decade. In Denmark, the National Service for the Feeble-Minded decided to phase out two of the most controversial institutions, those on Livø and Sprogø. Since the start of the century, these two otherwise uninhabited islands had been used to isolate "antisocial" mentally disabled young men and women. International critique of the "total institutions" increased in the late 1970s, when community mental health care became a central issue. In the new Danish plans for psychiatry in 1977, a commission under the Ministry of the Interior stressed that the hospital system should be based on community mental health care (Bjerrum, 2008). Management of the state mental hospitals was handed over to the counties and municipalities. However, when this decision was made in 1976, the psychiatric institutions still had a substantial number of beds, more than 11,000. However, this system changed during the 1980s, when treatment services were transferred to the new community care units, outpatient facilities and psychiatrists in private practice and so on. During the period 1980–1990, the number of beds in psychiatric hospitals was reduced by more than 4000. This development continued in the years that followed. An analogous deinstitutionalization process took place in the service for people with intellectual disabilities. In 1980, about 12,000 beds were available in Swedish residential institutions (*asyler/vårdhem*); in 1990, this number had dropped to 5000, and 10 years later it was 200 (Grunewald, 2009, 367).

In the 1960s and 1970s, patient associations had a crucial role not only in altering the former disability care system but also in fostering the empowerment of people with disabilities. The Swedish association FUB was the first to give people with disabilities the option to participate in the development of its policies. At a seminar in Stockholm in 1985, these issues were discussed for the first time with participants from Scandinavia and Finland. A specific project entitled "Our right to decide" (*Vår rätt att bestämma*) was developed by the NFPU, and it was a central theme at the annual conferences held in the following years (Bylov, 2010, 453–463). These conferences served as inspiration for the development of organizations such as the Danish ULF, founded in 1993, exclusively for persons with intellectual disabilities (Bylov, 2010).

The establishment of special education

Throughout the 19th century, many local and private initiatives led to the establishment of schools and education for children who were regarded as disabled. These initiatives could be termed early efforts toward special needs education since they featured teaching for children with disabilities. In developing these initiatives, professionals exchanged ideas and practices through visits and networks in Scandinavian countries.

Children were regarded as having the greatest potential and securing the best results in the light of usefulness for society. Therefore, all three countries established teaching for deaf–mute children at the beginning of the 19th century (Froestad, 1995, 83). This was pioneering work in all three countries, with no established professional networks or common policies across the Nordic countries supporting the work, which gave space for local initiatives and practices. These processes contained great variations in the countries, but, in all three cases, the state, in its policy for schools in general, also influenced the practice of deaf–mute education (Froestad, 1995; Coninck-Smith, 2000).

Whereas the first part of the 19th century was characterized by a pragmatic and practical approach to the education of deaf–mute people, ideological conflicts on the organization of the teaching and the question of the differentiation of students occurred in the later part of the century (Froestad, 1995, 327). The practice of teaching disabled people was influenced by academics putting forward different ideological positions in the different national contexts. The pedagogy for people with disabilities was not only developed through the education sector; other sectors, like that of social policy, also contributed to this process. The care and education of disabled people developed through initiatives from different professional actors, like teachers, philanthropists, clergymen and doctors.

Pedagogy played an important role in the institutionalization of people with disabilities in the 19th century, whether this took the form of schools directed toward different groups of people with disabilities or care institutions (Kirkebæk, 1993; Froestad, 1995). Pedagogy was debated among the professionals organizing these first initiatives, and there was an exchange as well as battles concerning the right way to teach. It was believed that pedagogy along with medical support could cure feeble-mindedness or at least make the individual fit to participate in the duties of the society. This reflected the ideal of the Enlightenment that individuals should be useful to society. The utopian hopes of education and cure had been abandoned by the end of the 19th century (Hansen, 2005). "The teacher and the amateur philanthropist became subordinate to the physician, the expert

who could classify the mentally retarded and determine the extent of mental retardation, and subsequently the amount of instruction required" (Hansen, 2005, 15).

Later, the "abnormal case" [Abnormssagen] in Nordic countries developed despite great differences as a form of joint project through Nordic meetings, joint journals and the exchange of ideas and practices. From 1876, special congresses for teachers within special education took place in the Scandinavian countries (Andersen and Stevens, 1957, 253). These joint initiatives across fields and borders contributed to the development of national values and practices within education and care for people with disability, leading to shared interpretations in Sweden, Norway and Denmark.

The Special Teachers College in Slagsta, close to Stockholm, played an important role in the training of Nordic teachers within the field of special education. In Norway, fellowships were available from the government for teachers to visit Sweden and Denmark to learn from those countries' experiences of programs for individuals who were regarded as mentally retarded.

National cases

In Denmark, a number of initiatives were launched to educate pupils who were perceived as disabled: the Deaf Institute was established in 1807, the first Danish Institute for the Blind in Copenhagen was founded in 1811 and the first Danish institution for the mentally handicapped/feeble-minded was created in 1855. Compulsory education for children who were perceived as abnormal was introduced in 1814. However, until the middle of the century, many mentally retarded individuals were still placed in the local communities without being accounted for in any way in the school system. There were also children with disabilities in public schools in the early 1800s, as evidenced by school records from the period. These were students who were deaf, were blind, had physical disabilities or were perceived as mentally retarded (Larsen et al., 2013, 262). Many children with disabilities were in larger care institutions, but, by the middle of the 19th century, these children increasingly became an object of educational interest (Larsen et al., 2013, 295). Children who deviated from the norm became increasingly visible in normal schools. Auxiliary schools and classes were established for these children. In 1900, the first auxiliary class was introduced, and, in 1913, an auxiliary school was founded in Copenhagen (Larsen et al., 2013, 305). It was not until 1937 that a law on special education was established (Egelund, 2000; Hamre and Ydesen, 2014). The law stated that municipalities were obliged to provide special education in cases in which the conditions provided the possibility for it. Feeble-mindedness caused special awareness among the Danish school authorities. In 1943, the Circular on Special Education stated: "For children recognized as feeble-minded/mentally handicapped, the Folkeskolen's [regular school] auxiliary classes have no place" (Hamre, 2012, 122–123, our translation). These schoolchildren should instead be referred to the special institutions for the mentally retarded. In the debate among the Danish teachers, the sorting of the children into special schools or classes was defined with progressive notions of individualization and differentiation, whereas those who were assessed as feeble-minded were defined with the notion of exclusion (Hamre, 2012).

In Norway, one of the former pupils of the Copenhagen Deaf institution, Andreas Christian Møller, created a Norwegian boarding school for people with hearing disabilities in Trondheim in 1825 (Eriksson, 1992; Frostad, 1995; Simonsen, 2000; Tønnesen, 2011). The advent of schools for the blind followed in 1861 in Norway (Kaimer, 2002; Ruby, 2002, 2011). In the Scandinavian case, Norway was the first country to adopt an act directed to students who were considered disabled, which was also unique in the European context (Froestad, 1995). The Abnormal Schools Act of 1881 introduced compulsory schooling for the deaf-mute, blind and mentally handicapped (Froestad, 1995, 337). The Ministry of Church and Education, in line with the legislation, appointed an attendant functioning as a director of "Schools for the Abnormal" in 1897. In 1915, a new version of the 1881 law was passed that including low-performing schoolchildren. Until 1949, the Ministry was responsible for special schools as well as for institutions for the so-called mentally retarded. From 1949 onward, these institutions for the mentally retarded were taken over by the Ministry of Social Welfare, whereas special schools continued to belong to the Ministry of Church and Education. In 1951, the parliament passed a new law, the Special School Act of 1951, on special schools addressing schoolchildren who could not attend regular schools. The new law was a further development of the 1881 law, aiming to provide education for schoolchildren who were regarded as "deaf, blind, backward (mentally retarded), maladjusted, and children with speech defects" aged between 8 and 21 (Andersen and Stevens, 1957, 252). The practice of abnormal schools continued after WWII, but the schools were hereafter titled special schools (Tønnesen, 2011).

In Sweden, an institute for the deaf and blind was established in 1808 in Stockholm (Grunewald, 2009, 61). An elementary school act was adopted in 1842, but it was to be run on a local basis (Westberg, 2019, 202). It has been argued that special education started in connection to this act (Wickman and Kristofferson, 2017), though many schoolchildren in practice were excluded from schooling. As elsewhere in Scandinavia, schoolchildren with learning disabilities were perceived as a problem for education in regular schools as well as for the teacher and for the whole class. Regular schooling had been compulsory for deaf schoolchildren since 1889 and for blind children since 1896. In 1944, a law made schooling compulsory for children who were regarded as "educable mentally retarded," and, in 1967, this law was revised to include children who were considered to be "profoundly mentally retarded" (Walton et al., 1990, 115). For children who were perceived as feeble-minded, school homes were established, the first one being in Stockholm in 1872, and the largest was established in Slagsta in 1911 (Grunewald, 2009, 55). The school homes developed educational practices for the feeble-minded and were isolated from the primary school and the auxiliary classes. By the 1960s, the school homes had closed and had been replaced by special classes (Grunewald, 2009, 315). According to Grunewald, the optimistic perception of feeble-mindedness changed due to eugenics theories, which meant that teaching, by the beginning of the 20th century, turned into training in practical skills (Grunewald, 2009, 321). In 1905, the first auxiliary class was established in Stockholm, and, a few years later, classes had been established in 15 cities (Grunewald, 2009, 334). In 1954, an

act was adopted stating that special education should take place primarily within primary schools. The term “special school” [særskole] was applied from 1955, and the school homes as boarding schools were abandoned, special classes in primary schools becoming the new practice (Grunewald, 2009, 339).

IQ testing, progressivism and professional demarcation

Educational testing became an important feature of the welfare societies in supporting a political interest in differentiating the future workforce and selecting the part of the population that was regarded as the most talented (Axelsson, 2007). Like elsewhere in Europe, eugenics and psychometric testing played a major role in Scandinavia in the sorting of students in the schooling system (Ydesen, 2011; Ydesen et al., 2013). Proponents of eugenics, for example, linked feeble-mindedness with bad morals, and this contributed to legitimizing the new exclusion of students to special institutions. The importing of psychometric testing from France and the USA to the Scandinavian countries in the 1920s and 1930s led to the sorting of students being legitimized by scientific practices (Axelsson, 2007; Ydesen, 2011; Ydesen et al., 2013). In the interwar period onward, IQ testing became the most important prerequisite for sorting the pupils in public schools. Teachers, educational psychologists and psychiatrists as well as progressive educationalists in Scandinavia were proponents of testing. In their view, testing was a practical tool to solve the problem of differentiation in schools and, according to progressive educationalists, a way to accommodate the individual teaching of children. There was an alignment between proponents of testing and progressive educationalists in the interwar years, and it does not make sense to distinguish between the two groups in practice (Nørgaard, 1977; Bendixen, 2006). The proponents regarded intelligence testing as the common ground to overcome limitations in examinations.

In the interwar years, the international progressive education organization New Education Fellowship (NEF) arranged meetings concerning child-centered education. Its largest conference took place in Elsinore in Denmark in 1929. The ministers of education from Sweden, Norway and Denmark were responsible for the initiative, regarded as being of the utmost importance for the educational field (Ydesen et al., 2013, 120). Mental tests were a prominent issue at the conference. Testing was a valuable technology for Scandinavian educators since it could assess the quality of the students as well as of the schools (Ydesen et al., 2013). Child-centered progressivists shared the same values with the intention to individualize and put the child at the forefront of education.

Generally, there were challenges in the assessment of children, primarily the questions of who had the authority to practice the testing and how children's problems should be interpreted. Dilemmas arose in terms of the professional demarcation between the two disciplines and the issue of authority to examine. Like child psychology, child psychiatry gained influence in the Scandinavian countries in the interwar years (Hamre et al., 2019). As in England, child guidance clinics emerged in Denmark, Sweden and Norway. Psychiatrists participated in the examination of pupils and thus in the process of referral to auxiliary and special schools. The Scandinavian experts initiated counseling activities based on a mixture of ideas drawn from mental hygiene, psychoanalysis and child psychology (Hamre et al., 2019). Mental hygiene clinics and school health services became important arenas for sorting schoolchildren. The mental hygiene movement has been regarded as a bridge between the biologically oriented hygienist of the early 20th century and the sociopolitical reforms of the interwar period (Axelsson, 2007; Stewart, 2011). Scandinavian experts attended the First International Congress on Mental Hygiene in 1930, and this led to the establishment of local mental hygiene associations. Professional attention increasingly turned away from eugenics and toward the context of upbringing in the family, the local community and educational institutions. In this process, local mental health movements played a crucial role in establishing child guidance clinics, outpatient treatment and child psychiatric wards in hospitals (Hamre et al., 2019). All three countries experienced a strong influence from psychoanalysis in the 1930s, 1940s and 1950s, and this contributed to the importance of environmental explanations, a process that was also enforced by the mental hygiene movement (Hamre et al., 2019). At the beginning of the 1950s, the three Scandinavian countries established child psychiatry as a university field.

The Scandinavian school system in the years after 1945

The period 1945–1970 has been titled “the golden age” of the welfare states in Scandinavia (Petersen, 2006). The ideal of equality has been regarded since the 1960s as an important tool to equalize differences in backgrounds and social inheritance. In this process, the schooling system had the most effective approach to mitigating social inequity. It underwent a modernization process in which the social democratic parties were the key actors. “Education for all children was also considered to be the main vehicle for reducing social differences and increasing social mobility in the population” (Imsen et al., 2017). The structure of schools was one of comprehensive schools without streaming. The state had a strong influence on the curriculum, and progressivism as a pedagogical mindset was related to the overall ideas of democratization, equity and social justice. “The comprehensive school was in itself seen as a stage in pupils’ democratic socialization as it placed them within a community where all classes of society would meet” (Telhaug et al., 2006, 253). The idea of a comprehensive school was very similar in Sweden, Denmark and Norway and experienced similar historical development, characterized by a strong influence from the social democratic parties (Imsen et al., 2017). In the years to come, the comprehensive schooling system was gradually revised, though the general idea remained.

Concerning special education, there was an increasing critique of the segregation into special needs education and the general conditions for children with disabilities. In Sweden, for example, the number of pupils in special schools doubled in the period 1967–1977 (Grunewald, 2009, 347). The critique proposed three ideals for the Scandinavian schooling system: normalization,

integration and decentralization (Walton et al., 1990). In the subsequent years, normalization was subject to more or less the same critique (Holloway and Hamre, 2018). In 1994, all three countries ratified the Salamanca Treatment, thus obliging themselves to embrace inclusion as the overall principal in schooling.

Conclusion

This article on the historical development of disability, mental disorders and special education in Denmark, Norway and Sweden took as its point of departure the practices of differentiation, the ideas formed by the Enlightenment that subjects are educable and the need to use all human resources in the modernization of society. The main question in the 19th century concerned how to differentiate the broad groups of individuals who did not conform to the ideals of the educable subject. Different institutional settings took form, whether they were for disabled people, for those with mental disorders or educational initiatives. This modernization process involved dilemmas between belief in the educability of the subject and ideas of social Darwinism, degeneration and eugenics.

The Scandinavian combination of the dominance of social democratic parties by the beginning of the 20th century and the development of eugenic policies formed practices targeting people with disabilities, especially those regarded as feeble-minded, thereby legitimizing practices of exclusion and sterilization. Scholars have questioned why liberal societies like those in Scandinavia could develop illiberal practices like these. Some of these practices were legitimized through eugenics, and others, like that of lobotomy within psychiatry, were founded on medical arguments as well as economic rationalities. The question is whether these historical practices developed despite the new ideals of the welfare state or whether these illiberal practices simply worked as a prerequisite for the functioning of the welfare state. Similarly, the development of special education was a practice that developed from existing exclusion practices that were enforced by the importing and use of IQ testing and assessments from different professionals.

Introduction

The purpose of this chapter is to provide a detailed overview of the Australian National Disability Insurance Scheme (NDIS); in particular, the piece explores ways in which by design, the NDIS engages with educational services in support of students with disabilities. The largest social reform to be implemented in Australia since the introduction of Medicare in 1984, which is the scheme by which all residents of the country are provided basic health care, the NDIS comparably signals significant change to disability support policy. The intent behind the scheme is to increase social and economic participation of every Australian living with disabilities, which was estimated in 2018 (ABS, 2019) to be 4.4 million, or 17.7% of the population, by supporting them to connect with services that they need, including medical care, schooling, therapy plans, community services and recreational opportunities. The NDIS is administered by the National Disability Insurance Agency (NDIA), which has statutory responsibility for its administration, in accordance with the [NDIS Act \(2013\)](#), which was hastily put together to guide scheme governance. Estimated to provide \$18–22 billion in GBP by increasing participation of not only people with disabilities into the workforce but also their families and carers ([National Disability Services, 2016](#)), the NDIS has large ambitions behind it for transforming the ways in which people with disabilities are understood, related to, and are anticipated to contribute in the Australian socio-economic landscape, to which an open and inclusive education system is directly relevant.

The chapter proceeds through five sections, each drawing on published research, NDIA reports and factsheets, as well as conceptual disability literature to explore the impact of the NDIS on education, in order to provide an explanation relevant to educators, students with disabilities and their families on the affordances and parameters of the scheme. In the first section, further explanation is provided about the NDIS and, in particular, how it is set up to benefit participants by emphasizing choice and control over funded support, while also building capacity more broadly across the nation for increasing inclusion for all people living with disabilities. In the second section, a deeper analysis is provided about the architecture of the scheme with respect to education, and the ways that its orientation both positions educational inclusion, and depends on broader inclusivity across the sectors, in order to be effective for achieving its ambitious outcomes. The third section then provides details about NDIS affordances to education in the early childhood, primary and secondary, and post-compulsory sectors. This section concentrates in particular on what the NDIS can provide to students who receive funded plans in terms of transitional support, equipment and associated services to support their education, and as well how the scheme might be drawn on to support educators in some instances. In this section the article inevitably touches on reported experiences of scheme participation particularly in and through the Global Covid-19 pandemic. The chapter concludes with a discussion of the contribution that innovative approaches to disability scholarship and activism might make to NDIS participation, to give emphasis to what it could mean to support a student with disability to achieve an equitable education.

The NDIS: how does it work?

The NDIS is a substantial piece of policy reform that was introduced into parts of Australia in 2013 before being rolled out across the nation from 2016. Prompted by a [2011](#) Productivity Commission report which found that disability services at the time were underfunded, inequitable, fragmented and inefficient, the NDIS has rapidly replaced state and territory run disability support with an insurance-based and individualized approach to funding that emphasizes user choice and control. The NDIS is notionally underpinned by a human rights approach to disability policy reforms and aligned with principles of the social model of disability, locating societal structures responsible for posing the foremost barriers to equal participation for people living with impairments rather than their biological conditions ([Oliver, 2009](#)). The NDIS marks a significant shift in disability policy in Australia. It

ostensibly provides greater scope to support people with permanent and significant disabilities from birth to 65 years of age to access support services commensurate with their goals and aspirations, while also building capacity of Australian services to adapt toward a more inclusive future whereby people with disabilities enjoy social and economic parity. Anticipated to fund up to 460 thousand recipients directly through funded care plans (a fraction of the estimated population of Australians disclosing disabilities), the scheme has already exceeded projections in both funded plans and dollar amount (NDIA, 2021a), leading to potential scheme derailment (Olney and Dickinson, 2019).

There are three types of support budgets available to funded participants: core (to support everyday activities); capacity building (to develop independence and skills over time); and capital (to purchase specific equipment for support such as assistive technology, or to make home and vehicle modifications). Person-centred disability funding is not new to some of the States and territories of Australia (Kendrick et al., 2017). However, by formalizing this approach, the NDIS has mobilized individual choice and control as the preferred national provision of disability support, also increasing portability for funded participants. One major difference that this change brings about is that whereas service providers—individuals or organizations that provide services or products to people with disabilities—received direct block funding from governments, they are now pooled into a market from which NDIS participants purchase support that reflect their lifestyle and aspirations. Participants deemed eligible for funded support are provided financial support on the basis that they make clear and achievable goals in their personal plans, against which reasonable and necessary supports are drawn to achieve their aspirations. In so doing, the NDIS aligns disability support in Australia with the United Nations Convention on the Rights of People with Disabilities (CRPDs) (2006) by emphasizing independence for citizens with impairments that affect their participation. Furthermore, the NDIS has reshaped disability support in Australia to a system that is more consumerist by nature, whereby consumers of products and services are included in Australian society in the sense that they are afforded the right to “choice and redress”.

On the surface, promoting autonomy and control for citizens with disabilities who receive NDIS funding represents a welcome upgrade to Australia's system of disability support. Framed in this way in particular, the NDIS is redolent of the current government's favoring inclusion initiatives for otherwise marginalized people on grounds social, economic, and for increasing independence. To this end, people with disabilities who receive funded packages to access support are anticipated to achieve a greater level of equality in their local communities by participating in the marketplace in ways that benefit their short and long-term goals. That being said, to ensure scheme sustainability, participant autonomy is always balanced against what is deemed reasonable and necessary. According to NDIA guidelines (2019), support can be considered reasonable and necessary only if it is related to a person's disability; is not simply responding to a day-to-day cost of living (such as rent or utility bills); is cost effective; is responsive to a persons' identified needs; and is balanced against supports already provided from other governmental services and a persons' informal networks such as carers, families and friends.

The elusiveness of the measures by which reasonable and necessary support is evaluated by the NDIA has been taken up by disability researchers, who have registered their concerns that inconsistencies emerge in their interpretation. To them, gaps between the promises of the NDIS and participants' lived experiences are a hallmark of the NDIS in its current form, and potentially into the future. Cost-benefit analysis and discretionary decision making on the part of planners tend to outweigh the aspirations of participants (Carey, Malbon, and Blackwell, 2020; Olney and Dickinson, 2019; Thill, 2015), and as Australia enters an unstable economic future, scrutiny of what reasonableness and necessity is will be likely further intensified (Kendrick et al., 2017). Indeed, a recent evaluation of the NDIS in its trial phase from 2013 to 2016 (Mavromaras et al., 2018) found a majority of participants would have liked to have more choice and control over the supports available to them via their funded plans, a concern that continues to increase steadily (NDIA, 2021a).

As previously foregrounded, only a fraction of the population is projected to receive personal funding from the NDIS at any one time, leaving the remainder of the population to draw from other services and informal supports. The scheme assures support for people with disabilities across Australia who do not receive direct funding, by way of the Information Linkages and Capacity Building (ILC) program. Designed to focus in particular on raising community awareness of the barriers that affect social and economic participation for people with disabilities while building greater capacity for their inclusion (NDIS Act, 2013), the ILC framework rather ambitiously seeks to consolidate mainstream service delivery with non-specialist, publicly-available information, while funding projects with these aims on an ad hoc basis. Such a project might be, for example, to ensure a public library service is more inclusive of people with vision impairments, by providing staff training and purchasing resources (NDIA, 2021b). Other initiatives provide information to people with disabilities about engaging with services and everyday living, such as freely-available podcasts (Independence Australia, 2021). While these initiatives are promising, there is little to mandate all service providers to develop more inclusive ways of working through the ILC as projects are generally funded on an ad hoc basis. Additionally, people with disabilities who do not receive direct NDIS funding have reported increased difficulty accessing support since the introduction of the scheme (Mavromaras et al., 2018).

The NDIS and education

A persistent issue relevant to Australians with disabilities and their families, the NDIS and educators, to which this article now turns to examine in more detail, is the ways in which the scheme connects with services such as education. The scheme's sustainability is

dependent on funded participants emphasizing access to mainstream services including education, health, housing, employment, justice and family support (NDIA, 2020a,b), rather than relying solely on NDIS-specific providers (Productivity Commission, 2017). The provision of access for NDIS participants to mainstream services is a shared responsibility between the NDIA and Commonwealth, State and Territory government services, which draw on principles that were drawn up that explain the roles and responsibilities of different service systems and the boundaries between them. Educational participation is a consistently strong objective of NDIS participants with funded plans since its introduction (Mavromaras et al., 2018; NDIA, 2021a), and the scheme might be anticipated to support children and people of all ages with disabilities to access and participate in inclusive learning by providing bespoke responses to identified needs. Nevertheless, the division between the scheme and cross-sectoral education services present a consistent obstacle to educational inclusion (Brien et al., 2017; Whitburn, Moss, and O'Mara, 2017a,b; Yates et al., 2021). There is also a danger that those who live with disabilities who are not eligible to receive direct funding through the NDIS will be further disadvantaged should mainstream systems not adequately support their needs (Knight, 2013). It is, after all, an expectation that either with or without ILC program support, mainstream services will be inclusive of people with disabilities.

NDIS participants who access the scheme at different life stages have reported experiencing a inimitable gap between the scheme and education (Brien et al., 2017; Whitburn et al., 2017a). This comes about, at least in part, because of the way that the NDIS was initially designed. While the voices of people with disabilities were instrumental to the scheme's development (Thill, 2015), the strength of a clinical understanding of disability was the catalyst for its detachment from education at the design stage. In a recorded podcast interview with *The Conversation* (August 10, 2016) co-founders of the NDIS explained that they felt forced to abandon engaging in a "war about content" of the terms of the scheme between carer organizations, who were in favor of special education, and disability groups, who wanted to use the scheme to re-imagine how exclusionary educational practices might be addressed. Explicitly eliminating educational considerations from the design of the NDIS effectively evaded the potential for the scheme to inform a pronounced cultural shift toward inclusion for Australians with disabilities, while at the same time side-lining the inclusive aspirations of people with disabilities over that of carers. The broader implications here is that although the NDIS encourages innovative responses to complex barriers to inclusion, it unfortunately does little to address how disability has been traditionally viewed as a problem to be fixed, thereby reinforcing the marginal status of many people who live with disabilities (Corcoran et al., 2019; Horsell, 2020; Kendrick et al., 2017; Olney and Dickinson, 2019; Thill, 2015; Whitburn et al., 2017a,b).

As will be explored in further detail in the forthcoming sections, something of a paradox emerges in the ways that institutions like the NDIS orientate to disability (Whitburn and Corcoran, 2021). Whereas education providers are said to increasingly acknowledge and work with difference affirmatively to provide strength-based, inclusive opportunities to learning participation, and the NDIS seeks to transform how social and economic participation for people with disabilities is enacted in Australia, the scheme nevertheless commences from a medically-informed, deficit-first orientation. Furthermore, the disconnections between both services motivates families of children with disabilities to fabricate support needs to ensure continuity of provision (Whitburn, 2017a). As Whitburn et al. also found, complexities of navigating scheme bureaucracy brings into sharp focus the necessity for people with disabilities to attain a relatively high base-level of education, if they ever want to manage their own plans, rather than having another organization or the NDIA undertake this role on their behalf. This article now turns to examine some of the affordances of the scheme across educational sectors for people with disabilities and educators, before concluding with a discussion of how affirmative orientations to disability could otherwise inform NDIS participation, to give emphasis to what it could mean to support a student with disability to achieve an equitable education.

Funding education: what will the NDIS support?

A simple search of the internet brings up countless references that suggest a clear connection between the NDIS and education, however this is only partly the case. Significantly, a line is drawn demarcating between what types of supports are provided by both services, with the deliberate and justifiable intent of complementing one another rather than overlapping. The provision of funded supports is also dependent on a range of variables, including educational sectors, types of supports required by individuals owing to their age and impairments, and the supports they require. In simple terms, the NDIS funds support directly related to a person's impairment, while the education system in each State and Territory is expected to cover expenses associated with their educational requirements. The Commonwealth Government under the Gonski 2.0 From Growth to Achievement report (McKew, 2018) and each State and Territory education department, has specific funding available to schools to specifically support students with disabilities, from which it is understood most funded support will be drawn. **Table 1** illustrates the support provided for students both by the NDIS and the education systems in each State and Territory of Australia.

Although the list presented in **Table 1** delineating responsibilities may seem clear, it is plainly not exhaustive, and some consequences emerge as a direct result of the demarcations therein. Additionally, there are subtle differences that the NDIS will fund depending on educational sector and type of impairment. In the following subsections of this article, further discussion is provided about the educational support provided, aligned with each educational sector from early childhood, primary and secondary education, to the higher and community sectors.

Table 1 NDIS and Education provisions for students with disabilities.

<i>Funded NDIS support for students</i>	<i>Education provider support for students</i>
Personal care needs associated with a person's impairment while they attend education	Teachers, education assistants and other supports such as Auslan interpreters, visiting teachers
Some therapy unrelated to education that may be provided during school hours	Therapy delivered in schools for education or training purposes, such as allied health practitioners helping teachers and trainers adjust curricula
Specialized training of teachers and other staff about the specific personal support needs of a student with disability	General support, resources and training for teachers, tutors and other staff
Portable equipment to aid mobility and/or communication	Aids and equipment to make curriculums accessible, such as modified computer hardware, software and braille textbooks
Specialist transport for travel to and from the education provider	Transport for educational or training activities such as excursions, field trips and sporting carnivals
	Adjustments to buildings such as ramps, lifts and hearing loops
	Day-to-day supervision of students at school, including behavioral support

Modified from [NDIA \(2015, 2020a,b\)](#).

Early childhood education

The early childhood phase is a core area of interest to the NDIS, for the reasons that through targeted, timely and specified interventions, the disabling effects of a child's impairment can be addressed and potentially reduced, thereby reducing their overall dependence on the scheme. Entitled the Early Childhood Early Intervention approach since the scheme's inception, which is a somewhat clunky name that emphasizes a preoccupation with risk mitigation associated with a child's disabling condition/s, this area garners particular investment. While it is important to recognize that most children in Australia commence primary school before the age of six, this section of the article concentrates on the early childhood education and care (ECEC) sector specifically (which is guided by the principles of the Early Years Learning Framework from birth-5 years ([DET, 2016](#))) as it relates to the NDIS. Approximately 16% of NDIS participants are children aged 0–6 years and their families or carers, and this group consistently represents a high proportion each quarter of applicants seeking scheme access through new plans, largely in response to early diagnoses of developmental impairments among children ([NDIA, 2021a](#)). In 2020 the NDIA launched a review, receiving 192 submissions on its impact for children and their families, and related stakeholders ([NDIA, 2020b](#)). The NDIA has rushed to make three recommendations quickly from the review, including stepping back from its deficit-based, intervention-centred inclination, and reframing it instead in terms of service delivery to children under nine years of age and their families, under the title the “Early Childhood Approach” ([NDIA, 2021a](#)). They have also sought to clarify operational guidelines and the criteria by which distinctions can be made to assess developmental capacities ([NDIA, 2021a](#)).

ECEC providers are anticipated to deliver reasonable adjustments under the Disability Standards for Education 2005 ([Australian Department of Education, Science and Training, 2006](#)), including any resource- or personnel supports they require to ensure an inclusive learning environment that facilitates enrollment and participation of all students. Aside from the types of NDIS funded supports foregrounded in [Table 1](#), including freely available information linking families with necessary information through the ILC program, the principles that delineate service responsibilities ([NDIA, 2015](#)) indicate that early childhood participants can receive transition support, intended both in making timely interventions away from disability-specific providers, as well as funding to transition out of ECEC into schools. The latter support is provided on the basis that the funding required is beyond typical school-readiness programs, to respond to a child's specific impairment or behaviour-related circumstances. With some therapy available to individuals during the hours a child may attend an ECEC service, the NDIS has increased the presence of disability specialists in these settings ([Boaden et al., 2021](#)). In spite of these promises of the NDIS to ECEC and the early childhood sector more broadly, the scheme's impact is yet to be realized ([Brien et al., 2017](#)). Parents and carers of children accessing the scheme have reported considerable challenges attaining support, along with diminished choice and control, and they express ongoing concerns that the values that therapeutic supports in ECEC settings are hampered because both systems are not able to work in collaboration ([Gavidia-Payne, 2020](#)). To this end, while the Early Years Learning Framework emphasizes family-centred, strength-based practices that provide for child-centred choice and control ([DET, 2016](#)), the impact of the NDIS in correspondents with the ECEC sector in support of these ideals is unclear.

Primary and secondary school

Accessing compulsory education is a consistently prevalent activity of NDIS participants ([NDIA, 2021a; Whitburn et al., 2017a,b](#)). To that end, while Whitburn et al. report that early plans of the NDIA during its initial trial phase were to provide single plans to school-aged children that would incorporate their education, similar to the joined-up plans available in England to support young people from birth to 26 years ([Hunter et al., 2020](#)), this has not found to have eventuated in the Australian scheme. Instead, there are guidelines that define what the NDIS will support in relation to the compulsory schooling sector, and what is understood to be

the responsibility of schools in providing equitable access to the curriculum, assessment and reporting along with all other students, as illustrated in [Table 1](#). That being said, there is a thin line between what both systems will fund, which may be open to diverse interpretations. The NDIS may fund specialist training to teachers and relevant school staff about an NDIS participants' impairment/s or behavioral needs, however where this strays into education-specific skills, these costs must be born by the school. Similarly, while the NDIS may fund some equipment that aids mobility or communication, such as wheelchairs, hearing aids and communication devices, any building modifications to support access, and assistive technology that a student might use to access their studies is to be provided by the educator. In another unclear delineation, services such as allied health that are unrelated to schooling may be provided during school hours and on school grounds. However, if such services are directly related to a students' schooling, these costs must be borne by the educator as a reasonable adjustment.

Invariably, these divisions have led to insufficient provisions from either service ([Whitburn et al., 2017a](#)), and as it has been expressed eloquently by a parent of a school-aged NDIS participant, "You leave the support at the school gate, and pick it up again at 3.30" ([Whitburn et al., 2017a](#), p. 1072). As the onus to support a student's education shifted rapidly from schools and teachers to parents and carers in response to the global Covid-19 pandemic, these concerns seemingly expanded. In a survey of student participants of the NDIS and their families, [Yates et al. \(2021\)](#) found that many were unable to obtain the technology and personal support they required for online learning, due to inflexibility in plans. Abandoned by both the education system and the NDIS, in many instances families with sufficient skills and resources had to resort to teaching their school-aged children with minimal support that was otherwise available at the schools. Many, however, reportedly went without support—an indication of the exacerbated inequity that is rife in the NDIS ([Carey et al., 2020](#); [Yates et al., 2021](#)).

One area of significance, for which the NDIS does provide direct support, relates to leaving school. Much in the way that specialist transition support is available into schooling for NDIS participants, specific funding to aid students transitioning out of the compulsory sector into employment is provided. A School Leaver Employment Supports program ([NDIA, 2021c](#)) can be accessed by NDIS participants in their final year of schooling, as well as their first post school year, which provides one-on-one job seeker skill development. Further, the NDIS has a Participant Employment Strategy which it launched in 2019 ([NDIA, 2021a](#)), through which 30% of funded participants are intended to be employed by June 2023. The strategy consists of six priority areas, one of which being to strengthen the link between education and employment outcomes for young people. Activities include reviewing current capacity-building programs, while strengthening work experience availability for NDIS participants while they are enrolled in schools. While these efforts seem useful, there appears to be a particular focus on disability-specific employment programs, while at the same time giving emphasis to overcoming individual deficits—a preoccupation similar to the plans available to young people with disabilities in England ([Hunter et al., 2020](#)). This point will begin engaged further in the conclusion to this article.

Higher education and vocational education and training (VET)

Education providers in the post-compulsory sector are also bound by law ([Australian Department of Education, Science and Training, 2006](#)) to make reasonable adjustments to their physical campuses, buildings and curriculum, to underwrite the enrollment and participation of all students with disabilities. The Commonwealth Government provides universities funding under the Higher Education Disability Support Program ([DET, 2020](#)) to cover any costs associated with these activities, however this is not available to educators in the VET or community sectors. NDIS participants are also afforded the same list of funded supports as are children and school-aged service users, including transition support both into and out of post-compulsory education. The agency will also provide specific training to teaching staff and placement supervisors as required, extending scope for this type of support outside the institution and into the workplace. While the ambiguity of NDIS funding for students in ECEC or schooling seeking NDIS support to participate in learning is just as relevant to students in the non-compulsory sector, it has been suggested that ongoing informal support throughout a student's course would be of particular use for those with autism spectrum condition ([Owen et al., 2016](#)), who might be at risk of attrition due to the unique structure of non-compulsory study.

Conclusion

The NDIS has been designed and implemented swiftly to capitalize on the widespread and bilateral support from opposing sides of the political divide ([Olney and Dickinson, 2019](#)). To this end, the scheme is still evolving, and proposed changes are ushered in quickly with minimal, or at best, overly complicated community consultation ([Boaden et al., 2021](#); [Kendrick et al., 2017](#); [Thill, 2015](#)). In this article the interface between the NDIS and education has been examined, the affordances of both systems for educators and students provided, and some of the challenges therein explained. It is clear that the NDIS, in its fledgling stage, has made a difference to the national landscape for disability and mainstream services. Yet, it operates on a "punitive and exclusionary" ([Carey et al., 2020](#), p. 14) approach to allocating the types of support people are eligible for, giving rise to some families exaggerating their deficits and needs ([Whitburn et al., 2017a](#)). Not everyone, of course, is able to advocate for their needs equally. Accordingly, disparities appear by way of NDIS provisions for participants from low socioeconomic backgrounds, people with cultural and linguistic diversities, and Indigenous Australians ([Carey et al., 2020](#); [Soldatic et al., 2014](#); [Yates et al., 2021](#)), entrenching the very inequities the scheme was intended to address. That the scheme was designed favoring the special education tradition, rather than to engage in

re-imagining how education across sectors and its linkages with employment might be made more inclusive for Australians with disabilities, is a legacy of this positioning.

In conclusion, this article provides a brief commentary as to how recent disability scholarship and advocacy might inform children and people with disabilities, their families and educators to think differently about engaging with services such as education and the NDIS, whether or not attaining funded support in so doing. In its present form, the NDIS is a hybrid between a system that seeks to promote human rights, by creating and giving access to a quasi marketplace for people with disabilities (Carey et al., 2020). This in itself is something of a contradiction, unless of course inclusion for people with disabilities is best measured by the degree to which they can operate freely in a market-driven culture. A systemic desire to increase social and economic participation of people with disabilities is laudable, and we might recognize that education and employment contribute financial stability and wellbeing for many. However, the scheme also demonstrably positions deficits within individuals, while seeking to increase their independence and claiming to adhere to principles of the social model of disability. While some might think that to critique these features of the NDIS is toxic, rife among published accounts of NDIS participation are troubling experiences associated with the scheme's architecture (Mavromaras et al., 2018; Whitburn et al., 2017a; Yates et al., 2021). We might wonder how things could be otherwise.

Recent developments in disability advocacy and scholarship invite us to consider how we come to know disability (Whitburn and Corcoran, 2021; Hunter et al., 2020), with a view to dismantling categories of deficit that were previously taken as read. This is to recognize that a complex intersection of disadvantages affects marginalization for people with diagnosed impairments, while at the same time finding solace in the relationships between people and the support mechanisms that ably complement their lives. The barriers that disable people, then, may be biological, but they could just as easily be social, political, and/or technological. Taking such a view to NDIS participation is to move away from tough concepts like independence, needs, and intervention, and to consider more how the relationships between people, technological devices, and even animals make activities possible. These are continually changing in relation to context. A person's NDIS plan might be understood not to tell things how they are, but how they might be in relation to these conditions, resources and the people who live them. As Hunter et al. also implore in the case of England, we only hope that the NDIA accordingly realizes the transformative potential of broadening its focus along these lines to increase the inclusive possibilities of the scheme for people with disabilities to achieve their educational ambitions in Australia.

Connecting disability and employment

The term “disabled” refers to a diverse group of people whose personal characteristics relevant to employment vary widely. Health, age, gender, socio-economic background and education have complex and dynamic relationships with impairment, employment and social inclusion (Banks and Polack, 2014; Meyer and Mok, 2019; World Health Organization and World Bank, 2011a,b). These interact with local cultural and economic conditions to influence individuals’ prospects in terms of work and earnings. Consequently, measurement of employment rates is a vexed issue; it depends to some extent on how “disability” is differentiated from the range of factors influencing employment opportunities as well as what counts as employment.

The meaning of “employment” and the availability of work varies especially between the Global North and South and between men and women. Nevertheless, globally disabled people are significantly disadvantaged in terms of employment across the range of types and severity of disability. Disabled people are less likely to be employed; they are on average paid less; and they are more likely to be in part-time, temporary and insecure forms of employment (Gunderson and Lee, 2016; Mitra and Kruse, 2016; Schur et al., 2017). Disabled people also receive fewer training and development opportunities than non-disabled people (Schur et al., 2017).

As disability is defined in relation to people’s ability to carry out everyday tasks and to participate socially, it is inherently linked to basic questions of people’s occupations and employment, age, health and social inclusion. Historically “disability”, “unemployment” and “retirement” developed as related constructs in twentieth-century welfare states, as work in industrial production intensified. As work disability increased among older workers, sickness benefit came to be used as a surrogate old age pension (Macnicol, 2011). This history suggests that the shift to wage labor – to jobs and contracted employment – entailed increasing work disability as performance and individual level productivity became critical aspects of work. Currently, disability employment statistics show that levels of disability resulting from musculoskeletal problems associated with aging are among the biggest contributor to disability employment statistics in the Global North and South, only age of onset differs (World Health Organisation, 2021). The shift to wage labor resulted in increasing de-recognition of other forms of work, especially the unpaid work of women (Ferguson et al., 2016; Standing, 2009).

In high- and low-income countries, disabled people overall have lower educational attainment (WHO, 2011), consistent with socioeconomic and gender-based disadvantage and unequal access to education. Education disparities alone do not account for employment outcome differences (Jones, 2008; Vormholt et al., 2018), but they do critically affect prospects for work. As labor markets increasingly select for higher levels of educational attainment in middle- and higher-income countries, this education and skills differential appears to be increasing over time (OECD, 2008). This suggests that disability employment gaps, that is differences between the employment rates of people categorized as disabled and others, may also grow.

In the Global North disabled people are among those targeted by activation policies seeking employment for all, on the grounds of social justice and reduced welfare spending. This “employment-focused paradigm” (Laruffa, 2020, p. 2) has been supported by the European Union and international organizations including the World Bank and the OECD. It includes incentivizing people to work using non-work sanctions and in-work benefits, and calling for investment in human capital to increase employability (see Laruffa, 2020). In the case of disabled people, such policies present employment as achievable and as the solution to entrenched associations between disability, low income and high social exclusion (see Grover and Piggott, 2015; Redley, 2009). By implication, there are no valid alternative routes to equal social participation when people are unable to attain or sustain employment. The high social value placed on employment – rather than work in other forms – is not confined to high income economies, as shown below.

Responding to disability employment gaps

The international community has addressed disadvantage in work and employment for disabled people as a development issue. The United Nations Convention on the Rights of Persons with Disabilities (UNCRPD) (2006) is the key agreement relevant to

employment for disabled people, namely Article 27 governing work and employment. The UNCPRD (2006) establishes a “right to work” and focuses on the disabling impacts of social attitudes and social arrangements, as key issues for employment in the disability context. The treaty advocates legal and policy mechanisms to uphold the right to work, such as measures to counter discrimination on the grounds of disability and the concept of “reasonable adjustments,” that is, employers’ duty to modify workplaces and practices for accessibility. Protection of the right to work in this convention is also promoted through equal access to education and training, opportunities for self-employment and entrepreneurial activities, and vocational and professional “rehabilitation”. Aspirations for disabled people in terms of work and employment are also inscribed in the UN Sustainable Development Agenda for 2030, where Goal 8 (Decent Work and Economic growth) recognizes the additional disadvantage in employment terms for disabled women and girls and for people with intellectual disabilities and mental health conditions (United Nations, 2016).

Yet competitive markets in employment are inherently difficult to reconcile with the overall diversity of disability. The summary version of the World Health Organization (2011) *World Report on Disability* cites two examples of successful accommodations in the workplace: a person using a wheelchair enabled by accessible buses and lifts, and a person with visual impairment whose disability is eradicated by corrective lenses. The examples echo social model of disability arguments that a suitably adjusted work environment may effectively erase disability. In such an erasure, impairment effects (Thomas, 2004) such as pain and fatigue, and the impact of impairments such as intellectual and developmental disabilities and mental health difficulties are underplayed (Morris, 2007; Shakespeare, 2006). Also downplayed are the complex associations between impairment, age, and socio-economic disadvantage, which are not readily rectified by accommodations. Arguments making the “business case” for disability inclusion focus on potential advantages in productivity and financial performance to be gained by employers from disability inclusion (ILO, 2019), making the case that employment is effectively conditional upon such advantages.

Overall the gap between employment rates for disabled and nondisabled people have remained stable following an unprecedented amount of policy activation in individual countries and through the UNCPRD (Sainsbury, 2018; Vornholt et al., 2018), including the activation policies targeted at individuals, legislation against discrimination and supported employment programs. Supported employment, that is, providing job search and job support services to people furthest from the labor market, is a practice with an international evidence base to improve employment outcomes for the rising number of people with mental health conditions (Modini et al., 2016). Nevertheless more than half of those supported may not gain employment (Corbière et al., 2017). For those with intellectual and developmental disabilities, supported employment has a chequered history with little impact on extremely low levels of employment (Blamires, 2015; Wehman et al., 2018). Similarly, evidence for the impact of anti-discrimination legislation is weak; the Americans with Disabilities Act (1990) and the UK Disability Discrimination Act (1995) seem to have had little positive impact on employment rates for disabled people (Bell and Heitmueller, 2009). Looking ahead, if the availability of jobs overall decreases through automation and technological change (OECD, 2019; Suskind, 2020), employment levels for disabled people are likely to lag further in middle- and higher-income countries. A shrinking jobs market is likely to have a disproportionate impact on disabled people, as it affects disadvantaged workers most (OECD, 2019) – that is people with lowest levels of education and skills, social capital and mobility. OECD forecasts for 2019 highlighted the increasing need to switch jobs flexibly and retrain extensively to remain in employment, while those for 2020 highlighted the jobs crisis arising from the Covid-19 pandemic and its potential to widen inequalities (OECD, 2020). Together with the failures of policy interventions to shift employment rates for disabled people, such projections point to the need to reconsider the primacy of paid work in disability policy.

Interpreting disability employment data

Examining the global evidence more closely, there are considerable variations in the scale of employment differentials between disabled and non-disabled people, and reasons to interpret employment statistics with care. Data focusing on whether or not disabled people have attained employment in high-income countries may also be relatively uninformative. Those without paid work are set aside from employment accounting as “economically inactive” even though a high proportion (30–40%) would like to work. For example, in the UK nearly half of disabled people are counted as “economically inactive”, while only 6% count as “unemployed” (Meager and Higgins, 2011; Evans, 2019). The overall picture of marked disadvantage in employment and earnings conceals large and important differences between groups and settings. First, data on the employment of disabled people across the world is significantly unbalanced, with greater information available for high-income countries than for low income countries. In comparing employment statistics, basic difficulties arise in the different inclusion criteria across countries and studies, with low-income countries often using narrower impairment-focused criteria and high-income countries broader “activity limitation” definitions (Mizunoya and Mitra, 2013). When statistics are adjusted for comparability, the average employment disadvantage for working-age men with disabilities is said to be around 12 points (53% employed by comparison with 65% of men without disabilities) based on survey data from 51 countries (World Health Organization and World Bank, 2011a,b). For women there is said to be a 10 point gap, arising in the context of overall lower employment rates (20% compared to 30% of women without disabilities). Mitra and Mizunoya (2013) found significantly lower employment rates for men with disabilities in most of 15 low-middle income countries, with significant differences between countries, that is, employment gaps ranging from 11 to 53 percentage points, and no apparent difference for six others. The statistics for women, discussed below, show less impact of disability status.

There are markedly different impacts on employment levels and earnings for people with chronic and severe impairment and for some types of impairment or disability. In Europe, people whose disabilities are classed as severe are approximately three times more likely to be unemployed than non-disabled people (World Health Organization and World Bank, 2011a,b). In low-

middle-income countries, evidence indicates people with multiple disabilities are significantly more disadvantaged than those with “single” disabilities (Mizunoya and Mitra, 2013). In the USA, men acquiring a chronic or severe disability experience dramatic drops in earnings (around 80%) over the first ten years following disability onset (Meyer and Mok, 2019). People with intellectual and mental health disabilities are also considerably more disadvantaged than people with other disabilities in employment terms, regardless of income level of country (Mizunoya and Mitra, 2013; Lysaght et al., 2012). In the UK, for example, around 6% of people with intellectual disabilities and 9% of people with significant mental health difficulties are employed (2019–2020), by comparison with 44% of disabled people as a whole and 78% of non-disabled people (ONS, 2019). In terms of earnings, the pay gap is twice as high for people with a “mental impairment” – a term that covers both intellectual and mental health related disabilities – as for people with a physical impairment (Evans, 2019). These differences between people with disabilities in employment terms are important reminders of the diversity within the category of disability which may be minimized in the employment-focused paradigm (see Meager and Higgins, 2011; Stevens and Harris, 2013).

Globally, the picture is affected not only by the imbalance in available information, but by the dominance of the Global North in setting the agenda for disability studies. The framing of disability and employment issues in much research and policy formation reflects the cultural and political dominance of the Global North (Meekosha, 2011). This includes that of the UNCPRD (2006) since the concepts and processes of human rights discourse are “culturally Eurocentric” (Meekosha, 2011, p. 678). This Global North inflection affects critical questions of how exclusion from work is counted and how priorities are set. Grech (2008) notes that the large majority of disabled people are located in parts of the Global South where levels of poverty provide multiple conditions for the creation and maintenance of impairment. Meekosha (2011) questions how the production of disability in the exploitative working conditions of sweatshops in the South, for example, comes to be such a neglected phenomenon.

Two further issues arise in the context of Global North conceptions of disability in relation to employment: i) the interpretation of work as a matter of employment in the formal economy, and ii) the implications of this construction of work for understanding the mechanisms driving employment statistics for disabled people. In the Global South, data and policy on rights and protections for disabled people in employment largely revolve around contracted employment in the formal economy (Mizunoya and Mitra, 2013), though this may represent the work of a minority of people. This focus may be particularly inappropriate in relation to the lowest income countries where a majority of workers may be in the informal economy, in small trading, subsistence agriculture and other unregulated forms of work. Self-employment in the informal economy may have advantages in terms of low barriers to entry and flexibility that make it particularly prevalent among women and disabled people (Mizunoya and Mitra, 2013; Schur, 2003). Hence, there is no employment gap between women with and without disabilities in some African countries, though one exists for men (Mizunoya and Mitra, 2013). This underscores the significance of gender rather than disability in rates of employment for women, and indicates how the economic activity of women and disabled people may be overlooked when formal employment is the measure of participation.

The idea that it is the strictures of formal employment that particularly affect disabled people is also supported by statistics comparing urban and rural settings in low-income countries. These show less disadvantage for disabled people in rural settings, where formal employment is less available. Similarly, the disability employment gap is larger in middle-income countries where formal employment is more prevalent compared to low-income countries (Mizunoya and Mitra, 2013).

Variation in the connections between disability and employment may point to a wider conclusion about exclusion from the jobs market and its consequences. Persistent negative employment statistics for disabled people may be informative about how jobs markets are shaped, and made inaccessible, by the pressures of global competition (see e.g., Grover and Piggott, 2015; Moore et al., 2018) while providing relatively little information about what excluded people do or want to do.

Summary

Independently of definition of disability, data source, country or time-period, disability has a negative effect on employment and earnings. Commonly, statistics for formally contracted work are interpreted as a measure of how far the rights of disabled people are protected in terms of work, and how far such people are contributing to and socially included in their communities. Relatively little is known about other kinds of work by disabled people, especially work in the informal economy, and how far it is preferred by people unable or unwilling to conform to the exigencies of paid employment (Schur, 2003; Mizunoya and Mitra, 2013). Evidence suggests that working as an employee is difficult to achieve and demanding to sustain for some disabled people (Moore et al., 2018; Vornholt et al., 2018), and that it may be increasingly inaccessible for many disadvantaged people, including disabled people, in the future. Meanwhile, the capability approach (Sen, 1999) offers a framework for reconsidering employment, work and disability in relation not to employment metrics but to people’s freedoms to pursue the kinds of life they value.

The capability approach

In considering the disability/employment intersection, this chapter has highlighted disparities regarding employment outcomes and the potentially distorting role of applying in a global context understandings of disability and priorities for disability policy that derive from a minority world perspective. The capability approach developed by Amartya Sen and others (Sen, 1999; Robeyns, 2017) is a conceptual framework that has advantages for conceptualizing disability and employment because of its central focus on

diversity in the personal characteristics of individuals (such as health, gender, education, mental, physical and sensory abilities), how these interact with their social and cultural contexts and the value systems they hold. The capability approach is primarily concerned with questions of human development and inequalities, and has been understood as a means to reconceptualize disability as an aspect of “pervasive” (Sen, 1992, p. 1) human diversity, like age and gender rather than part of an abled/disabled binary (Burchardt, 2004; Mitra, 2006). In employment terms, the capability approach highlights the meanings and functions of forms of work within the lives of the people concerned, rather than focusing on metrics of employment and earnings (Bartelheimer et al., 2012; Yeoman, 2014). With diversity as a central rather than secondary factor, using a capability approach means taking into account personal characteristics as they operate within a person’s physical environment, in interaction with the relevant social and cultural conditions, and in the light of the individual’s aims and objectives. According to Sen (1992), the question of equality is demanding precisely because such pre-existing variations imply the need for unequal treatment in favor of people who are disadvantaged.

In the capability approach, it is the agency of people rather than their resources *per se* or their “wellbeing” that is paramount – their freedom to be and to do the things they judge to be valuable. Hence, development is not necessarily a matter of economic growth, technological advance, or social modernization, but a process of “expanding the real freedoms that people enjoy” (Sen, 1999, p. 3). “Poverty” is understood as deprivation in the capability to live a good life, and “development” as a matter of expanding people’s capability (Robeyns, 2016). This makes it relevant equally in high-income countries as in the majority world, where debate on development is often focused. Sen (1992) argues that intergroup contrasts in high-income countries may be stark, with disadvantaged groups lacking the basic opportunities of health care, education, employment, or economic and social security in spite of the broader context of prosperity. This is the case for certain groups of disabled people, for example, for people with intellectual and developmental disabilities, who are effectively excluded from socially valued forms of employment, and thereby from a central means of social participation. The capability approach has been applied extensively in the context of education, and offered as a framework to define the ethical purposes of inclusive education (Reindal, 2016). It is proposed here to support an argument for work – outside the restricted parameters of employment – as a means to extend the capabilities and social inclusion of people most disadvantaged in relation to employment. Yeoman (2014, p. 236) refers to work as “a mode of being in the world which transcends the employment relation to include all the activities which contribute to producing and reproducing a complex system of social cooperation”. Work in this sense is “meaningful” and can be understood to be a fundamental human need.

In addition to its uses in reconceptualizing the employment/disability intersection and what matters to those involved in it, the capability approach has also been developed and used as a tool to evaluate policies and institutions, such as the design of a welfare state or the priorities of poverty reduction strategies (Robeyns, 2017). The *World Disability Report* (World Health Organization and The World Bank, 2011a,b, p. 11) uses it as a means to understand “the obligations that states owe to individuals to ensure that they flourish, exercise agency, and reach their potential as human beings.” Setting employment as a core target of policy for disabled people misrecognizes diversity in people’s needs, purposes and environments, effectively reducing their capability to their capacity to participate in a given economy (Laruffa, 2020). From a capability approach perspective, the benefits of employment should not be taken for granted; indeed, as Meekosha (2011) points out, some forms of employment involve the production of disability. Instead, the extension of people’s capabilities, especially the key capabilities of learning and social inclusion, may be a more productive aim in the context of employment and disability.

Rethinking employment: the case of intellectual disability in high-income countries

People with intellectual and developmental disabilities are particularly affected in employment terms – that is, by low levels of employment, limited employment options, and adverse experiences in employment. The UK and Australia provide examples of conditions in high-income countries with comparable economic and policy contexts, where, as Sen (1992) argues, inequalities may be substantial. Links between work, learning and social inclusion mean that work might extend the capabilities and social inclusion of this group. These links outline some of the “goods of work other than money” (Gheaus and Herzog, 2016) that may be more attainable by people with intellectual and developmental disabilities outside the conventional parameters of employment than within them: opportunities to learn, to make a social contribution, to experience community and receive social recognition.

In high income countries, employment is a central factor structuring adult lives and identities for the majority. It is often cited as the primary means of social participation and linked with better health and mental health (e.g., Bambra and Eikemo, 2009), with learning and personal development (Manuti et al., 2015), social engagement and finding meaning in life (Yeoman, 2014), as well as earnings. It is therefore striking that around 93% of people with intellectual and developmental disabilities in the UK are not in employment (Public Health England, 2020). When they do attain employment, these assumed benefits are likely to be unrealized, on account of limited options for work, reduced hours, low pay and experiences of rejection. These issues define the need to consider ways of engaging in work outside the parameters of competitive employment.

When the majority of people are in employment, an immediate practical outcome of lack of employment for people with intellectual and developmental disabilities is under-occupation and social and spatial separation from working people. A recent review of literature relating to opportunities for engagement in meaningful occupations found a “concerning pattern of inactivity” among adults with intellectual and developmental disabilities (Channon, 2014, p. 443). Research involving young people in relatively

privileged circumstances – those expected to have benefited from modernized, personalized services – found them to be experiencing a strong sense of exclusion and under-occupation. Merrells et al. (2019, p. 16) summarized their participants' experiences with the phrase: "We always feel left out... experiencing exclusion and rejection from paid work in the community ... and having nothing to do." A research theme of "Not sitting around on my backside all day at home" featured a young adult's report on his "boring lifestyle": "Um, cleaned my house, did my dishes, um, went to the shops, looked around, got some DVDs last night to watch, yeah... get bored so I just go to the shops, but the shops get boring after a while" (Merrells et al., 2019, p. 17).

Under-occupation is often combined with lack of hope. People with intellectual and developmental disabilities and their families have been found to be pessimistic, with reason, about their chances in employment (Beyer et al., 2016; Giri et al., 2021). Many have extensive experience of trying to find and keep paid work, of placements that don't work out, in demanding circumstances experienced as "craziness" (Ramsey, 2020, p. 131). Recent research offers examples of how both seeking employment and being in low quality employment can increase people's sense of alienation from the majority. Experiences of social and employment rejection are commonly reported, for example:

"I tried nursery at one point, I thought I could get into nursery, that's when it hit me, I had a disability actually."

Ramsey (2020, p. 182)

The sense of frustration at the parameters of employment can be acute. Merrells et al. (2019, P. 16) report a young woman describing how a "mainstream person":

"doesn't understand how ... where we're coming from because she hasn't got a disability, it's hard to say what we feel like... it was really, really hard to handle and I just completely shut down."

The employment options open to people with intellectual and developmental disabilities are limited, which leaves people struggling with their aspirations and how to live their lives. A woman with a range of short-term employment experiences reflected on the disorienting impact:

what work I don't want is easier to say than what I do want because what I do want is kind of impossible, it's not realistic. I don't know you know I'm like in my thirties and I have no idea what to do.

Ramsey (2020, p. 171).

The constricted parameters of employment, its demands for efficiency and productivity, are structural – recruitment is a discriminatory process. An example of how competitive processes can play out in people's lives is given by a young adult who had obtained work clearing plates and washing dishes, but was losing out in the competition for shifts:

"I find it really difficult. Um, because I find it hard to keep up with everything because I know everything has to be done at a certain time... So, um, yeah, so I phoned up, like, last week to see if there's any more shifts, and there haven't been any shifts for me, like, this week, so ...yeah."

Merrells et al. (2019, p. 16)

Employment in these circumstances is unlikely to offer financial security; indeed most people with intellectual and developmental disabilities work too few hours, at too low rates of pay to become independent of state benefits (Public Health England, 2020); see also Dearing, 2020). Basic advantages of employment escape their grasp.

The dominance of formal employment in the economies of high-income countries means that there are limited other means of participating in society in significant and sustainable ways. A consequence of marginalization within, and exclusion from, formal employment is the loss of access to processes of social participation and learning that are fundamental in human society. Sociocultural approaches to learning (e.g., Lave and Wenger, 1991) depict critical links between learning, work and social inclusion, according to which a learner's participation in social practices defines the content, manner and extent of their learning. Such learning is seen as the primary means by which individuals make sense of and act on the world. Lack of participation, then, compounds the learning disadvantage of intellectual impairment. According to participatory learning theory, human learning originates in social, historical, and culturally specific interactions, where learners negotiate new learning challenges that are within their reach when supported by others. The literature explores how "novices" – children, young people and other kinds of newcomers – are inducted into the practices, knowledge and beliefs of their cultures by taking part in them, following pathways of increasing complexity over time (Rogoff et al., 2016). Learning by a given individual is therefore inseparable from the context within which it is embedded and from the support of others (Matusov, 2001), so that being there, taking part and having support are essential to learning and understanding your world.

Education, and by extension learning, have a critical place in the capability approach for their potential to enhance capabilities. Social inclusion is also a key capability (see [Reindal, 2016](#)). Much attention has been paid in education and disability studies to the question of inclusion in schooling and its relation to social inclusion. While the rhetoric of inclusion is everpresent in educational discourse, it coexists with policies and practices of segregation and the ranking of students ([Slee, 2019](#)), and with peer victimization and social rejection of minority groups ([Juvonen et al., 2019](#)), which critically affect what social learning takes place. In this way inclusive education can act as “an accomplice in the exclusion of students with disabilities” ([Slee, 2019](#), p. 911). From a capabilities perspective, these aspects of education jeopardize one of the critical tasks of learning - to challenge “adaptive preferences,” the tendency of disadvantaged people to adapt their aspirations according to their situation ([Watts et al., 2008](#)). In spite of these contradictions, people with intellectual and developmental disabilities share with non-disabled peers culturally defined experiences of formal education – that is, they attend schools. By contrast, the practices of work that are dominant in adult life are largely unexperienced. From this perspective, the learning and social participation aspects of work matter all the more for capabilities and inclusion.

It is important that the learning involved in social participation is not conceived as a one directional process of transmission of knowledge and values to the “newcomer”. Rather, as individuals take up different positions in relation to the cultures and practices they encounter, these are continuously reshaped. [Rogoff \(2003, p.51\)](#) describes this process as “people contributing to the creation of cultural processes and cultural processes contributing to the creation of people, so that individual and cultural processes are mutually constitutive.” Learning in this sense accounts for how cultures and practices evolve over time ([Tomasello, 2016](#)). According to these understandings, the absence of people with intellectual and developmental disabilities from the places and experiences of work represents a loss to society of opportunities for mutual learning and social adaptation. An outcome of exclusion, and a perpetuating factor, is that disabled people generally have been absent from the public sphere and consequently inhabit “a cultural, political and intellectual world from whose making they have been excluded” ([Abberley, 1999](#), p. 15).

In employment as in education, an “ethic of competitive individualism” ([Slee, 2019](#), p. 909) dominates policy and practice in ways that drive the social isolation of people with intellectual and developmental disabilities. Yet it is personal and relational support in work that is a condition of participation for many for people with intellectual and developmental disabilities. This is clearly expressed by a young woman interviewed by [Meltzer et al. \(2016, p. 44\)](#) as she worked in a social enterprise, having experienced open employment. They sum up: “Would you try another open employment job? Nope. Why not? No support.” A participant in [Ramsey’s \(2020\)](#) study spoke directly about the impact of unstable employment and how relational support differentiates sustainable from unsuccessful experiences of work:

“Basically, I’ve always been in and out of work, this is what people don’t understand is quite hard. The only reason I’m doing really well at the moment in my job is my team. If I didn’t have my team, wow.” (p. 133)

Independence in the sense of operating without support is highly valued in society. People are assumed to be self-sufficient and “significant discursive and material pressure is exerted on encouraging them to become so” ([Davy, 2019](#), p. 105). This ideal is reflected in policy and practice for people with intellectual and developmental disabilities in England ([Department of Health and Social Care, 2014](#); [NHS England, 2019](#)). However, feminist thinkers argue that independence, autonomy and self-sufficiency – for any person – are “foundational myths” ([Fineman, 2013](#), p. 13), designed to keep human relations of dependence and interdependence in the private sphere. Employment is framed in line with the ideal of the employee as an autonomous, self-made individual without caregiving responsibilities or support needs. This is particularly problematic for people with intellectual and developmental disabilities, whose need for relational support may not be so easily confined to the private sphere. [Davy \(2019\)](#) argues the need to rethink concepts of independence and care, maintaining that relationships are key to the development and exercise of agency and that this reality is heightened for people with significant support needs. This argument implies that interdependent relationships in work – including dedicated personal support and reciprocal support among co-workers – can extend the capabilities and agency of people with intellectual and developmental disabilities, allowing them to contribute in the public sphere of work. Interdependence is a characteristic feature of human culture - collaboration and collaborative learning are key drivers of cultural evolution ([Tomasello, 2016](#)). Interdependence generates social solidarity - shared experience has a strong and sustained impact on social closeness between those involved ([Wolf and Tomasello, 2020](#)). It is known that personal contact with people with intellectual and developmental disabilities specifically is associated with support for their rights and capabilities ([McConkey et al., 2020](#)). This suggests that the loss of opportunities for sustained work with others, due to the way that employment is framed, is a fundamental disadvantage, distinct from the disadvantage of not earning a wage, because it precludes processes important for extending the capabilities and inclusion of marginalized people.

This chapter includes examples of the importance to people with intellectual and developmental disabilities of working and receiving support in work, but meaningful social inclusion cannot depend solely on the granting of support by non-disabled people. Greater acceptance of mutual dependence and interdependence and wider opportunities for collaborative work might give scope for people with intellectual and developmental disabilities to build agency through their interactions with others. Recent research gives an example where expectations of lack of competency in the workplace rouse an individual’s commitment to show otherwise. The participant talks about being doubted at work:

"Then it seems like, "You can't handle it" ... "Well, sorry pal, but that? You can't do that." That hurts me ... when someone tells me, "Someone else will do that," then I think, "No! Heck, no! Absolutely not. I'll do it myself, even if it takes me three or four hours" And when it's finished three or four hours later, they come back and say, "Is it taken care of?" ... Then they stand there like, "Huh? Okay, you can do it after all." Yeah, that gives you a kick. ... that's the confidence that you can inspire in someone, and that someone can inspire in you!"

Voermans et al. (2021, p. 243)

This account tallies with Billett's (2008) argument about the interdependence between personal and social agency that operates in work situations. He emphasizes how individuals exercise agency through their decisions on the degree and nature of their engagement in learning and work. A further example of positive interdependence is given by a young person with intellectual disabilities motivated by opportunities in her work to give support. She understands how she herself gains by giving personal attention to the elderly people with whom she works:

"you have time for that resident, and that's what I really like about it ... hmm, contact, just having a chat, for the resident, that in itself means a whole lot and, yeah, for myself, well, I think like, "Now I've done something useful again," just because I also know that those residents get hardly any attention, and then I can do that myself, and they like it a lot."

Voermans et al. (2021, p. 245).

Voices such as these suggest ways in which interdependence in working situations can result in dynamics that are more reciprocal than the granting of inclusion by nondisabled people.

In summary, the numerous initiatives to promote employment for people with intellectual and developmental disabilities that have taken place in recent decades have had a very limited impact on employment statistics (Hatton et al., 2016), and particularly have failed to reach people with "moderate" and higher levels of support need (e.g., Stevens and Harris, 2013). Focusing in policy on employment and whether people count as in or out of employment or as "economically inactive" has proved to be counterproductive, limiting the capabilities of people with intellectual and developmental disabilities and their possibilities for social inclusion.

Conclusion

Formal employment processes are inherently discriminatory; globally, employment is less accessible to women and to disabled people. The high social and policy value placed on this specific form of work compounds the disadvantage of both groups. Indeed, "employment-focused" policy may be poorly compatible with the goal of social inclusion for many disabled people. There is a need to recognize the inflexible, contingent and situated nature of that market, so that employment is not held as the ultimate object and failure to be employed as personal failure. The social learning value of work more broadly conceived may have greater potential to extend the capabilities of disabled people and to promote greater interdependence between people with and without disabilities.

Introduction

Poverty and disability have a continuously, intertwining relationship that largely stems from the systematic inequalities disabled people experience. This article aims to explore this relationship, contextualizing it with secondary data and literature analysis. First, it will critically examine how different institutions conceptualize and measure both poverty and disability. Second, it will focus on how disabled people are largely over-represented in poverty data, and some of the potential reasons for this. Following on from this, the third section of this article examines the political decisions that have led to the over-representation of disabled people in poverty in the UK. In doing so, we argue that poverty is a political choice that has led to many disabled people being denied their human rights. The fourth section highlights this further with stories and interviews gathered from [Ryan \(2019\)](#) that demonstrate the dehumanizing impacts of poverty on disabled people's lived experiences. Finally, this article concludes by reasserting the significance of the relationship between poverty and disability, while maintaining that poverty is indeed political.

Measuring disability and poverty: more than limitations and lines

Both disability and poverty have been contested categories, with multiple definitions. This is because there is no one definitive or standardized way to decide who is disabled, nor who is living in poverty. Measuring disability and poverty therefore requires subjective, political decisions to be made, and so any statistical data that is created cannot be neutral. Nevertheless, statistics play an important role within contemporary society and categorizations are employed to make different social groups comparable with one another, particularly in terms of social inequalities ([Mau, 2019](#)). As a result, different aspects of social life become quantified and numbers are used to "establish and ascribe social worth" ([Mau, 2019](#), p. 19). There is a concern, however, that metrics are used to rationalize certain behaviors, while demonstrating the social order, which is controlled by perpetual counting and categorizing of persons, as a form of governance ([Mau, 2019](#), p. 19). This can create problems for certain groups that experience inequality, such as disabled people, as they may not fit with the fixed formula of what their society values the most ([Reckwitz, 2020](#)). Those who are in poverty and/or disabled find themselves subject to unstable and turbulent categorization ([Stone, 1984](#)).

There are multiple definitions and ways of measuring poverty, using a variety of deprivation indicators, including: income, food, fuel, and well-being ([Alkire et al., 2015](#)). Although the importance of a multidimensional poverty measurement is recognized ([Alkire et al., 2015](#)), income-related poverty measures are still most prevalent ([UN, 2018](#)). Income poverty draws upon the idea of a fixed poverty line, whereby a threshold of income and expenditure is set in order to determine the number of people living in poverty ([Alkire et al., 2015](#)). This creates a threshold that represents how much income a household needs to be able to afford the basic necessities to meet their physical needs ([Alkire et al., 2015](#)). Those who fall below this threshold are considered to be living in absolute poverty or destitution ([Alkire et al., 2015](#)).

Taking this threshold approach, the UK government traditionally relies upon just one measurement of median income to create their statistical analysis of how many people live in poverty, both before and after housing costs, such as rent and mortgage payments ([JRF, 2016a](#)). The idea of the poverty line, however, has been criticized for not accounting for the full complexities of the lives of impoverished households ([O'Connell et al., 2019](#)). Relative poverty is considered a better alternative by some social scientists, as it accounts for both the social and physical effects of poverty, including, for example, not being able to offer a visitor a cup of tea ([O'Connell et al., 2019](#)). To exemplify, in their work toward solving poverty in the UK, the Joseph Rowntree Foundation (JRF) draws upon a notion of relative poverty to understand how many impoverished households there are ([Goulden, 2020](#)). Typically, the JRF focuses upon income poverty after housing costs, and their poverty line/threshold is set at those who are below 60% of median income, which is then supplemented with an indicator based on the Minimum Income Standard (MIS) ([Goulden, 2020](#)). The MIS is the amount of income needed to afford to meet minimum needs, such as being able to pay for food, shelter, warmth, and

other essentials such as toiletries, or take a shower. Anyone who goes completely without these things is considered destitute (JRF, 2016a, 2020).

This model of poverty allows for an understanding that begins to recognize the variety of lived experiences for those within poverty. The JRF (2020) employs the MIS to identify three different levels of poverty and with each level there is increasing financial hardship. Here, anyone who falls below the MIS is considered to be in poverty and anyone above can afford a decent standard of living, or better. The first level of poverty consists of those whose income is below the MIS, but is not less than 75% (JRF, 2020). Though people living in this level of poverty can often manage day-to-day, they are at risk of being pushed further into poverty by unexpected expenses and events (JRF, 2020). The second level of poverty consists of people whose income is under 75% of the MIS, and, as a result, there is a high chance that their needs are not being met and they have a poor standard of living (JRF, 2020). The third level, representing those who are deepest in poverty, is destitution (JRF, 2020). The JRF defines destitution as being when a person has lacked two or more essentials (such as, shelter or food) within a month, or when they have an income of less than £70 per week (Goulden, 2018).

However, a key issue with poverty measures more generally, is that governments can alter how they choose to measure poverty. Commonly used measures of poverty draw upon income and basic needs to determine the proportion of people in poverty (Alkire et al., 2015). Yet, looking at the proportion of people in poverty is problematic as a “decrease of any size in the income (or unmet basic needs) of a poor person paired with a corresponding increase for a non-poor person will leave poverty unchanged”, and vice versa (Alkire et al., 2015, p. 4). For example, in the UK, child poverty was shown to drop during the 2008 financial crisis, but on close inspection, this was because the recession had decreased overall household income (Ryan, 2019). More recently, the UK Conservative government altered the measurements of child poverty by scrapping the 60% median income measure, which saw a “fall” of people in poverty. Yet, critics of the proposed changes noted that child poverty was set to increase due to austerity measures, and the Conservative government was simply moving the goal posts, for example, by refusing to consider household income at all (Stewart and Roberts, 2019).

Similarly, governments can also alter how they choose to classify and measure disability. As such, decisions about who counts (and is counted) as a disabled person have changed over time (see, for example, DWP, 2020a). The ways in which disability is currently defined and understood have been profoundly influenced by the social model of disability (Oliver, 1990; Barnes, 2012). Originating in the 1970s within the UK’s Disabled People’s Movement (UPIAS, 1976), this model sought to redefine disability as a specific form of socially created disadvantage and marginalization that occurs to people with “particular mind and body traits” (also known as impairments) (Lawson and Beckett, 2020, p. 1). As such, disability is no longer framed as an individual problem requiring medical or technological solutions, rather it is “one of tackling disadvantage or exclusion,” which “necessarily requires different institutional expertise” (Lawson and Beckett, 2020, p. 20). This can allow for potential policy reforms to be more easily identifiable (Lawson and Beckett, 2020), thus could be particularly fruitful when considering the over-representation of disabled people in poverty. Although the distinction between disability and impairment is not always maintained, the social model’s reframing of disability has had a profound impact on governmental bodies and policies, perhaps most notably with its influence in the development of the United Nations Convention on the Rights of People with Disabilities—2006 (UNCRPD) (Lawson and Beckett, 2020).

Despite the influence of the social model, the distinction between disability and impairment can collapse when we begin to look at poverty statistics. For instance, in the UK, the Department for Work and Pensions (DWP) identify disabled people as:

Those who report any physical or mental health condition(s) or illness(es) that last or are expected to last 12 months or more, and which limit their ability to carry out day-to-day activities a little, or a lot.

DWP (2020a, p. 11).

Here, rather than defining disability consistent with the social model, the DWP identifies disabled people based on their impairment effects (see Thomas, 1999). This may influence who does and does not identify as disabled. Moreover, different individuals may have different interpretations of what it means for a condition to “limit their ability to carry out day-to-day activities,” which, again, may affect self-identification (DWP, 2020a, p. 11). This individual model approach to disability, which places limitations as resulting from “physical or mental health condition(s) or illness(es)” (DWP, 2020a, p. 11), is not limited to statistics within the UK; such an approach also appears within welfare policy (DWP, 2020b). Thus, policy purported to mitigate the barriers to employment and the extra costs that disabled people can face are equally subjective.

Judgments regarding who is entitled to financial support for extra costs, through Personal Independence Payments (PIP), are based on external, subjective assessments of the “severity” of impairment and its impact on function (Gray, 2017). Consequently, these judgments are subject to change. For instance, a judgment was made that being “unable to undertake journeys due to ‘overwhelming psychological distress’” did not warrant financial support with mobility, through PIP (Kennedy, 2018, no pagination). This meant that approximately 220,000 disabled people were denied the support they needed (Kennedy, 2018). After a High Court judgment deemed this to be unlawful discrimination, and in violation of human rights, this decision was overturned (Kennedy, 2018). Hence, it is important to consider the precarious nature of governmental support when examining the relationship between disability and poverty. Not all disabled people will receive the financial support necessary to mitigate the costs of oppression, and therefore may be more likely to live in poverty than non-disabled people. Perhaps unsurprisingly, then, disabled people are

extremely over-represented in impoverished populations, irrespective of the type of impairment or living standard indicator that is used (Morris and Zaidi, 2020). The next section of this chapter identifies and explains the reasons why this may be the case, with a particular focus on extra costs and reliance on social security.

Disability and poverty: why so many?

The over-representation of disabled people in poverty stems from both a disabling society and the social determinants of ill-health. Although this article focuses on the former, it is important to note that poverty has been found to be “closely associated with most causes of impairment,” even those that appear to be hereditary or caused by natural disasters (Swain and French, 2014, p. 48). These causes of impairment, which can stem from poverty, include: limited access to healthcare; poor nutrition; poor hygiene and sanitation; inadequate housing; and dangerous working conditions (Swain and French, 2014). This may help to explain why there is a higher prevalence of disability/impairment in low-income countries (World Bank, 2020).

The struggle of disabled people being trapped in poverty, thus, extends globally. Disabled people, in all forms of poverty measurement (hunger indicators, traditional poverty income, household expenditures) are much more likely to be in poverty than non-disabled people (UN, 2018). Additionally, disabled people are much more likely to be experiencing multidimensional deprivation, in areas such as housing, education or healthcare. In high-income countries, such as the UK, income poverty was found to be the most prevalent (UN, 2018). Whereas, in low-income countries the picture was more varied. Although households with disabled members tended to have fewer assets and worse living conditions compared to other households, some studies found no significant association between disability and living conditions (UN, 2018). This may be because the income gap in low-income countries can be less extreme between households with disabled members and households without (Shakespeare, 2012). Nonetheless, this income may still need to stretch further, as disability-related costs can still be a factor (Shakespeare, 2012). In addition, in countries where there is no universal healthcare system, impairment-related expenses are also a factor, as healthcare costs can be a significant expense (Shakespeare, 2012). Consequently, this could increase the likelihood of disabled people living in poverty in these countries.

Out of 41 higher income countries, the UK was ranked 16th on tackling poverty, 34th on food insecurity, 15th on health and wellbeing, 31st on economic growth, and 6th on reducing inequalities (UNICEF, 2018). Even though disabled families only make up 34% of the total population in the UK, they make up 40% of the number of people living with relative low income in 2018/19 (Francis-Devine, 2020). Yet, these figures do not account for the additional living costs that disabled people can face (Francis-Devine, 2020). Typically, households that have a disabled person in them face additional costs toward their everyday living. These extra costs can range from paying for mobility aids or house adaptations, to paying for support, care, or even fuel costs. These account for, on average, £583 of additional costs; these extra costs are equal to just over 50% of their total income, even if the disabled person has access to extra cost benefits (Scope, 2019). Over time, research has continually shown that these extra costs are not fully covered by the government support available (Morris and Zaidi, 2020). As the benefits that are purported to cover these additional costs are included as income in the statistics above, a more accurate picture of the amount of disabled people living in poverty may be gained by adjusting the measure (Francis-Devine, 2020). Removing these benefits from our measure of income shows that “people living in families where someone is disabled made up around 47% of the total population in relative low income” before housing costs and 46% after housing costs (Francis-Devine, 2020, p. 29).

By providing an income, employment can offer some protection from poverty, although it does not entirely prevent it (Bourquin et al., 2019; JRF, 2016b). Despite this, the UK government consistently places emphasis on employment as the main route out of poverty (see DWP and DE, 2011). This is particularly problematic as employment rates are dependent upon the needs of the market (*capitalism*) and the government (Grover and Piggott, 2005). Moreover, disabled people have lower employment rates than non-disabled people, due to a number of barriers (Grover and Piggott, 2005). Some of these disabling barriers may be reinforced by poverty as having access to money can help to alleviate some of their effects. For instance, barriers to employment, such as inaccessible application forms, can be mitigated when personal assistance can be financed. Seemingly, in recognition of these extra costs, the government provides some financial support for disabled people seeking work through Employment and Support Allowance (ESA) and Universal Credit. Yet, there have been multiple reports that have highlighted that this support is insufficient, unfit for purpose, and even actively harmful (Dwyer et al., 2016; UN, 2016).

Furthermore, one in three children in the UK are in what UNICEF calls “multi-dimensional poverty”—which measures deprivation in several areas linked to children’s rights, including: housing, clothing, nutrition and access to social and leisure activities (UNICEF, 2018). Previously, the JRF (2016a) found that children who were labeled as having special needs were more likely to experience poverty than their non-disabled peers and were less likely to leave school with qualifications and outcomes that would help to prevent poverty from reproducing itself for them as adults. Thus, for children, the reproduction of poverty through generations can manifest itself within the education system, where so-called inclusive education further marginalizes disabled students (Slee, 2014). Despite there being different intersectional differences, many disabled people find their lives are broadly impacted by deprivation (Singal, 2011). Formal education can be a way for disabled people to access a better quality of life. However, disabled children have limited access to education, which is further impacted by the cyclical recreation of poverty across generations, where disability, poverty and education share a connection (Singal, 2011). This is supported by the JRF (2020) who estimate that one-third of disabled children in the UK live below the poverty line. This is attributed largely to changes to the welfare system, where families with disabled children were estimated to have lost around £1750 a year.

In relation to this, the DWP estimates that between 2018 and 2019 £400 million went unclaimed, due to either DWP or claimant error. Claimant error is defined as occasions where benefit claimants did not provide accurate enough information or did not report changes to be reassessed (DWP, 2019). As a result, 84% of those being underpaid by the DWP were those claiming for support with extra costs through PIP (DWP, 2019). This is noted by several independent reviews of PIP, which state these figures could be due to an inaccessible, long, and confusing assessment process for claimants (Gray, 2017). Other recommendations for PIP included: making clearer what claimant responsibilities are; ensuring evidence given by carers or appointees of the claimant are given more weight in the decision-making process; transparency of why a decision is made; and, regular auditing to ensure consistency across assessments (Gray, 2017). However, some claimants still find themselves distressed, frustrated, and worse off after applying for benefits. The War on Welfare (WOW) campaign highlights this with its collection of testimonies from welfare claimants, including Helen, who states:

... My latest PIP Assessment is the closest to breaking me, the extended torture of pushing through the Appeals Process after a woefully inadequate Assessors Report left me £450 worse off a month and my management and care regime in tatters. Deliberate institutional harm by the Government and its lackeys.

WOW (2018, no pagination).

Another claimant, Gary, talks about the loss of his wife, and still being expected to attend his assessment for his work capability assessment review in order to receive financial assistance (related to employment barriers):

6 (six) days after my wife died, I duly turned up for the assessment. I went home and waited for the brown envelope to arrive, now bearing in mind that nothing had changed in my conditions since the first assessment, except for the small fact that I had lost my wife, I was told that I was being moved from the ESA support group to the work-related activity group and would consequently lose £30 a week. I asked for a mandatory reconsideration only to be told the decision was upheld. I could have appealed the decision, but to be completely honest I did not and do not have the energy or emotion to fight anymore. I guess that is what they hope for, that people at their most vulnerable, won't fight them.

WOW (2019, no pagination).

As shown in these examples, the relationship between disability and poverty runs deep within social institutions, such as the welfare state and education system. This is especially prevalent in countries where austerity measures have been in place to reduce government spending on social care and welfare programs (Ryan, 2019). For example, according to the UK foodbank charity the Trussell Trust (2020), in 2018–2019, the top three reasons for food bank referrals were: income not covering the cost of essentials (33.11%), benefit delays (20.34%), or benefit changes (17.36%). This indicates that food insecurity (a measure of poverty) is intricately wrapped up with the current welfare state system. Consequently, many people are relying upon charitable donations, in this case through food banks, to meet their most crucial needs. The following section examines the role that austerity has played in creating this level of poverty in the UK, and its significance to the relationship between disability and poverty is explored.

The politics of poverty

Poverty can be argued to be a political choice, where public funds are not used to help those in need. Instead, disabled people who claim welfare are blamed and vilified for the economic downturn (Benstead, 2019; Ryan, 2019). Within the context of the 2010 Liberal Democrat-Conservative Coalition, the UK government were under obligation to try to minimize impact of the recession on the poorest in society, through spending cuts (Benstead, 2019). This could have been achieved by making full use of all resources and making spending cuts fall on those who are financially better off. They also had the option of introducing measures, such as closing loopholes that have allowed large companies to avoid paying tax, or reducing tax breaks for the rich (Benstead, 2019). This could generate enough money to spend on essential government services. Instead, the government chose to give tax cuts to the most privileged in our society, while implementing cuts to welfare and social care that caused a reduction in human rights for people living in poverty or deprivation (Benstead, 2019).

Funding cuts to services, then, were justified by the government through notions of austerity and fairness (Hamnett, 2014). Under the conventions of the UNCRPD (2007), there is room for a country to regress in its progress on disabled people's human rights, if there is significant economic or political unrest, such as invasion, or a major natural disaster, and the government used this to justify austerity measures (Cooper and Whyte, 2017). For Cooper and Whyte (2017), austerity became a form of violence in three distinct stages of government deception. First, was the idea that came from the government that every person had played a role in the 2008 financial crisis. The second deception was that austerity was absolutely necessary and that catastrophe was imminent, unless harsh austerity measures were put in place. The third deception was the idea that "we are all in this together," implying that everyone in the country was to be equally impacted by austerity measures. Yet, this often repeated political phrase masks the fact that those hit hardest by austerity are targeted groups, such as working-class people and welfare claimants. It was through these deceptions that the government was able to avoid addressing social inequalities, and so, while the UK's top earners benefited from lowered tax rates, many people who needed assistance went without (Cooper and Whyte, 2017).

Thus, the real politics of austerity stabilizes the economy so that the rich sustain themselves, ultimately extending wealth by increasing inequality (Cooper and Whyte, 2017). At the same time, austerity has allowed for the disposition of rights by reducing and privatizing public services, while permanently dismantling the “protection state” (Cooper and Whyte, 2017). This occurred as the government utilized the panic around reducing the state deficit as an excuse to dismantle social welfare, which impoverished disabled people desperately relying on the support of the state as a main source of income (Cooper and Whyte, 2017). These changes to the welfare state have been popularized through discourses of “fairness,” which imply that needs-based social welfare has, in itself, become a source of unfairness (Hoggett et al., 2013). This is further supported by a long-standing anti-welfare rhetoric that positions benefit claimants as “scroungers” who abuse the system (McEnhill and Byrne, 2014; Briant et al., 2013; Garthwaite, 2011).

A significant proportion of the responsibility for benefit system “abuse” has been attributed to disabled people by the state (Hoggett et al., 2013). Consequently, the governmental category of “disability” has been reconfigured, along with the “rights and responsibilities of disabled people in relation to work and welfare” (Dwyer et al., 2016, p. 1). The process of reclassifying the criteria, of who is considered disabled, has tightened so that it only applies to the fictitious idea of the “truly” disabled (Garthwaite, 2014). Because of these changes, disabled people continue to be suspicious of the system, and feel depersonalized by the assessment process (Garthwaite, 2014). Those with invisible impairments, such as mental health issues, struggle to be recognized as disabled under PIP guidelines where participants are forced into black and white tick boxes on government forms, even though their lives are more shades of gray (Jamieson, 2020). This reduces their suffering, and the barriers they face in society, to a number on a form, casting them as abnormal. As Jamieson (2020, p. 35) states “... You can’t just put people into mad, bad, or sad.” Yet, the DWP attempt to do just that, with a box-ticking culture that stigmatizes claimants for being “bad citizens” when they are unable to provide for themselves financially (Jamieson, 2020).

Some have attributed the stigmatization and systematic discrimination faced by those receiving benefits to necropolitical governance (Mayblin et al., 2019). Necropolitics builds on biopolitics: where tools are used for the governance of certain population’s lives, to argue that necropolitics is the next step, where undesirable populations have their deaths governed by political violence (Mbembe, 2019). Biopolitics is an act of governance that allows states to use the population as a resource to build capital (Campbell, 2013). Therefore, biopower is the state’s power over life, as opposed to power over death. This governance ultimately controls certain behaviors or characteristics of the population, by using the standard of “the norm” (Campbell, 2013). Necropolitics argues society has transitioned into an even more violent and oppressive governance of populations, through the state’s use of political power and violence to subjugate oppressed peoples into the category of the living dead (Mbembe; Davies et al., 2017; Mayblin et al., 2019). Within these categories an individual or marginalized group does not live their life as a full citizen but is not yet physically dead. The latter idea is supported by Mbembe who argues the group experiences “death-in-life” (Mbembe, 2003, p. 21) that comes from states deliberately creating poor conditions for life. Citing the UK government’s gradual decrease in the amount of financial support asylum seekers receive, Mayblin et al. (2019) argue this results in systematic impoverishment, despite there being human rights laws that the UK ascribes to, which are meant to protect asylum seeker’s human rights. Necropolitical governance divides society into three categories: the living, the dead, and the living dead (Mbembe, 2019). The *living dead* are those who are not physically dead, but, because of political violence that pushes them into poverty, they experience a life not lived to an adequate standard, for example, not being able to pay for heating or food, because you lack the income from the welfare system to do so (Mayblin et al., 2019).

Porter (2018) extends this argument to consider disability extra cost benefits and the subsequent changes to the categories that govern acceptance or rejection. This, she argues, can be characterized as a politically violent form of social control over increasingly impoverished disabled people. The disabled welfare claimant, then, is part of the living dead, because they cannot have an adequate standard of living without access to the extra income PIP could provide them with. Specifically, over 7990 people died within 6 months of having their PIP claim rejected (DWP, 2019). Yet, we know that these decisions can be overturned, as approximately 72% of PIP appeals are won by claimants (Scope, 2019; in Porter, 2019). The application for benefits is also a very lengthy process; 17,000 people have died within the last 5 years while waiting for their PIP claim to go through (DWP, 2019). This means that potentially thousands of people have died before having access to the money that they needed to keep them out of poverty and ensure their human rights (Porter, 2019). It is important, therefore, to remember that disabled people’s poverty is a political choice. The social policies that exist within the UK have left disabled people more impoverished than in previous decades: a situation Ryan (2019, p. 40) describes as “near-Dickensian levels of hardship” in one of the world’s richest societies. The next section of this chapter will highlight the impact that this has had on disabled people’s lives.

In their own words: the lived experience of disability and poverty in the UK

Francis Ryan (2019) relates multiple stories of disabled people’s experiences of austerity in the UK. One harrowing case is that of Susan. Under government reforms to the social care system, Susan now must contribute to her own care costs, having to find £57 a week of her own money for this. Another £4 goes on a network alarm, in case she falls and needs emergency assistance. If she does not have the money, it will be turned off. Susan’s reduced benefits means she can rarely afford to buy food. Her bowel condition means she cannot eat solid food, but to get chemically pureed food costs £3.50 a time. She survives on porridge instead, as this is £2.00 a box for the week. She has lost four kilos in five years and tells Ryan (2019) she is starving.

Another story is that of former nurse, Racheal, who has had her entire social care package removed (Ryan, 2019). Without someone to help her into bed at night, she now sleeps fully clothed in her wheelchair. Five out of seven days she does not shower, eat regular meals, or get dressed, because there is no one to help her. She could not afford the extra payments that she is expected to make to access care, after she transferred to the new disability benefit, PIP, and her money was drastically reduced. Over the past year, she has been told she is clinically malnourished. When her arms are strong enough to lift a pot, she makes stew for the week. On her bad days, she survives on fruit and bread.

As explained earlier in this article, this inequality also extends to disabled children. Take this case, from Ryan (2019), for example:

Louis is 9 and is homeschooled. He has autism, sensory processing disorder and dyspraxia. He was excluded from mainstream school aged 6. He was labelled as a naughty child, and his exclusion came two weeks before his diagnostic appointment. This has impoverished the family, as his mother had to give up work meaning: "Things are hard financially ... we just about get by but have no money spare ... we live day to day."

Louis's mother, Joanna, cited in Ryan (2019, p. 185).

This is not unusual for parents of disabled children. 48% of parents surveyed by Contact (2014) had to either reduce their working hours or give up work completely. With a limited amount of financial support for carers, it is unsurprising that this can lead to poverty. Like the other benefits mentioned in this article, Carers Allowance has multiple conditions attached to it, meaning that not all carers will receive it (Gov.uk, no date). In addition, at the time of writing, the income it provides is just £67.25 a week (Gov.uk, no date), which is less than the amount of income needed to be considered destitute (Goulden, 2018).

Moreover, the experiences described here are not unique. Since the implementation of austerity measures in the UK, many disabled people have seen their income fall drastically (Ryan, 2019). The impact of this can be seen in the form of a loss of human rights for those affected (UN, 2016). Contact (2014) reported a worrying trend in families with disabled children increasingly going without essentials, such as: days out/leisure time (84%); clothes (65%); car fuel (40%); specialist equipment (36%); food (31%); and heating (33%). Going without had health implications for both disabled children and their parents, with 49% of those surveyed stating they have had ill-health as a result and 22% stating that their child's health has worsened (Contact, 2014).

Conclusion

This chapter demonstrates how the relationship between disability and poverty is a contentious and complex issue. The political and subjective decisions regarding how the two concepts are defined and measured impact the ways in which we are governed, as citizens. By deciding the conditions that determine who is living in poverty and who is disabled, governments can adjust the amount of financial support provided to its citizens. Through changing these classifications, governments can define the scale of the problem and therefore justify any interventions (or lack of them). Consequently, governmental decisions can greatly influence the number of people that are living in poverty.

Because of the way poverty is structured, education can be a way out of poverty. However, this is denied to many disabled people who find themselves segregated from their non disabled peers, and unable to gain formal qualifications for the labor market. The segregated nature of education for disabled children allows poverty to reproduce itself across generations.

The over-representation of disabled people in impoverished populations is, thus, to a certain extent a political choice. In the UK, and we suspect more broadly, austerity has had a significant role in this over-representation, allowing for a reduction in living standards to be justified as fair and proportionate (Cooper and Whyte, 2017; Hamnett, 2014; Hoggett et al., 2013). Yet, as we have seen, the impact of austerity disproportionately fell on marginalized groups, particularly disabled people (Ryan, 2019). The impact of this cannot be understated. Testimonies from impoverished disabled people and their families demonstrate the dehumanizing impact of poverty, which is then reinforced by the government, particularly through the welfare state. This, we argue, is a form of necro-political governance whereby many disabled people are not permitted to join the living. Rather, disabled people in poverty become the "living dead", as their human rights are denied, and they are unable to live their lives in a fulfilling and meaningful way.

Acknowledgment

We would like to thank the Center for Disability Studies at the University of Leeds for their ongoing support, with special thanks to our respective supervisors: Dr. Alison Sheldon, Dr. Tom Campbell, Dr. Angharad Beckett, and Dr. Joanne Greenhalgh. Special thanks to Rebecca Porter's study skills tutor Taiyybah, for her continued support.

Introduction

It is at once extraordinary and unsurprising that gender is a major determinant of access to education. Put simply, girls are less likely than boys to go to school and, when they do, they tend to leave earlier and with lower educational attainments. This failure to meet girls' right to education has been documented copiously, at national and global levels. Despite welcome progress over the past twenty years, gender inequality persists in many countries, especially in Africa and Western Asia, both in access to schooling and in post-school opportunities. The 2019 *Global Education Monitoring* (GEM) Gender Report (UNESCO, 2019) summarizes a mass of data, and the figures for gender parity in education make for stark reading (p. 8):

- 1/3 of countries have not achieved gender parity in primary schooling.
- 1/2 of countries have not achieved gender parity in lower secondary schooling.
- 3/4 of countries have not achieved gender parity in upper secondary schooling.

A subsequent report found that for twenty countries, mostly in sub-Saharan Africa, fewer than 1% of poor rural women completed upper secondary education (UNESCO, 2020, p. 68).

The link between poverty and low educational achievement is all too familiar. The GEM 2020 Report (UNESCO, 2020) gives an up-to-date picture, documenting the extent to which poverty is associated with low school attendance and completion, and reduced learning opportunities. The impact of poverty begins even before schooling starts: in low- and middle-income countries, large numbers of children from the poorest households are malnourished, "severely compromising their opportunity to benefit from education" (p. 6). An estimated 17% of the school-age cohort—258 million children and young people—are not in school. These school absentees are disproportionately from the poorest households. As documented in the GEM 2020 Report, disparities by family wealth in attendance and completion rates are large and enduring: the poorest children are least likely to attend school in the first place, most likely to repeat a year or leave school early, and have lowest levels of proficiency in literacy and numeracy.

Disability is a third strand in exclusion from education. Again, this is a long running story and the picture is, if anything, even more challenging. There are numerous data at national and global levels detailing the exclusion from schooling of children and young people with disabilities. Two sources can be cited briefly to indicate the scale of the challenge. The *World Disability Report* (WHO/World Bank, 2011) documents, for many countries and globally, the extent of the educational exclusion of children with disabilities, summarizing that they "... are less likely to start school and have lower rates of staying and being promoted in school" (p. 206). Indeed, the gap in school attendance between disabled and non-disabled children was close to 60% in some countries.

The *World Disability Report* (WHO/World Bank, 2011) documents the strength of the association between disability and school exclusion and the interaction between disability and other factors associated with exclusion. The correlations between low educational outcomes and disability are generally higher than the equivalent correlations for gender, economic status or rural residence. In other words, children and young people with disabilities are at even greater risk of school exclusion than girls or those from poor backgrounds. On top of that, there is an interaction between these factors: girls with a disability are more likely than boys with a disability to miss out on schooling or have limited educational outcomes; and children with disabilities from poor backgrounds are likewise at even greater risk of educational disadvantage.

A more up-to-date picture is provided by the GEM 2020 Report (UNESCO, 2020). The Report collates a large amount of data that displays the continuing association between exclusion from education and poverty, gender and disability. It affirms that "Children with disabilities are particularly at risk of exclusion from education" (p. 10). Despite the challenges in collecting data on

disability, it presents compelling data on the educational disadvantage experienced by children with disabilities. They are more likely than peers to be excluded from school, to attend segregated provision when they do go to school, to have fewer years of schooling, and to finish school with lower attainments. In one study (GEM Report team analysis of MICS and ASER Pakistan data), for instance, children with disabilities were 19% less likely to achieve minimum proficiency in reading than those without disabilities (p. 10).

This triple exclusion from education—based on gender, poverty and disability—is indefensible. Not only are the resources needed to educate all children and young people available, but the failure to deploy them results in enormous waste of human potential. Those who question the need for action, but question its affordability need only look at expenditure in other areas. To take just a few examples—global military expenditure, governments’ acquiescence in revenue foregone through tax avoidance and manipulation, the massive resources produced at short notice to deal with the impact of Covid-19—it is evident that resources can readily be found to meet certain priorities. (There is copious literature on each of these areas, not least in respect of income support schemes and other economic subventions during Covid-19. The Stockholm International Peace Research Institute is a reliable source on military expenditure around the world, documenting a total spend of more than US\$1.9 trillion in 2019 alone (<https://www.sipri.org/>). It is difficult, if not impossible, to calculate the total loss to national exchequers arising from tax avoidance and manipulation. Some estimates are available, however. International Monetary Fund (IMF) researchers calculated an annual loss to Governments of \$600 billion from selective tax avoidance techniques in the international corporate sector (Crivelli et al., 2016). The Tax Justice Network has estimated a loss of \$427 billion a year to tax abuse and evasion (<https://taxjustice.net/reports/the-state-of-tax-justice-2020/>). These figures are minimal estimates and do not take account of tax avoidance by individuals, inefficiencies in tax collection or the economic distortions caused by the tax avoidance industry, and it is likely that the total loss to Governments—with consequent impact on social spending budgets—is very much larger than the IMF or Tax Justice Network estimates).

So, what can be done to ensure a higher priority for the education of girls, particularly girls from poor backgrounds and/or with disabilities? If we can demonstrate that it is possible to educate these girls, at relatively little cost, maybe mindsets will shift a little. If, moreover, it transpires that such education is a productive investment resulting not only in greater human fulfilment, but also in net economic benefit, the case for such investment cannot readily be gainsaid.

The purpose of this chapter is to explore this question and propose solutions by reference to a substantial intervention that has been running for nearly 30 years in five sub-Saharan African countries.

Girls’ education in sub-Saharan Africa

Girls’ education is widely recognized for its fundamental and wide-ranging benefits to humanity across a range of indicators, including economic growth, improved health outcomes, and tackling climate change (Sperling et al., 2016). Educated women earn more, have better jobs, have smaller, healthier and better educated families, and are more likely to be decision-makers in their homes and communities. The economic benefit of ensuring universal secondary education for girls has been valued at between \$15 and \$30 trillion (Wodon et al., 2018), and the importance of education in supporting women’s leadership, particularly in low- and middle-income countries, has been identified as key to climate change adaptation and mitigation strategies (Brookings, 2021).

This makes a pressing case for tackling the issue of girls’ exclusion from education, which means addressing the urgent and inter-linked challenges related to gender, poverty and disability. Our focus here is on the marginalization experienced by girls from poor households in rural areas of sub-Saharan Africa where poverty is the greatest barrier to education (Morris et al., 2017). With many households surviving on less than \$1.25 per day, a lack of funds for both direct and indirect school-going costs creates the constant threat of exclusion from school among marginalized girls, or prevents their access entirely. Other poverty-related issues such as hunger can make it difficult for them to attend school regularly, learn while they are there, and study effectively at home. Poverty is also a key driver of practices like early marriage—both a cause and effect of girls’ exclusion from school—with girls facing pressure to get married to bring in more resources to their families, either through the “bride price” or through simply reducing the number of mouths to feed. In Tanzania, for example, 31% of young women aged 20–24 marry before 18 years and this rises to 49% among the poorest quintile, and 56.7% of young women have begun childbearing by age 19 (Tanzania DHS, 2016). Barriers are exacerbated for girls living with disabilities: the likelihood that children aged 12 in sub-Saharan Africa have ever enrolled in school is 10% lower for children with disabilities than those without, and the gap is bigger for girls (Wodon et al., 2018).

These issues are further compounded by the lack of education provision in remote, rural areas. Secondary schools are widely dispersed which has a significant impact on the retention of marginalized girls, who may be faced with long, tiring walks to and from school, or are forced to seek accommodation away from home with relatives or villagers close to the school; these factors, along with inadequate supportive infrastructure, are even more significant barriers for girls with disabilities. Both scenarios leave girls vulnerable to abuse, including sexual abuse (Stein, 2014). The under-resourcing of government schools in rural areas severely compromises the quality of education they can provide, and an academic curriculum that lacks relevance to rural young people’s reality and perceptions of their future, coupled with outdated pedagogy, also serves to undermine girls’ participation and self-esteem. The learning crises created by these circumstances contribute to pressure on girls to drop out of secondary school. This is compounded by the fact that when poor parents perceive education to be of low quality, they are less willing to sacrifice their limited resources to keep their children in school (World Bank, 2018)—a rational response which nevertheless perpetuates a cycle of exclusion.

The CAMFED intervention

One organization that has taken on this challenge is CAMFED (Campaign for Female Education, www.camfed.org), an international NGO serving girls and women in rural sub-Saharan Africa. Founded in 1993, it started out by providing bursaries to an initial cohort of 32 girls in Zimbabwe to attend secondary school; by early 2021, it had supported the education of more than 4.8 million marginalized children across five countries: Ghana, Malawi, Tanzania, Zambia, and Zimbabwe. CAMFED's work focuses on girls and young women because they are the most marginalized group in the communities where they live, but also provides some support to boys where they face similar barriers, and both girls and boys benefit from interventions to improve the learning environment and boost learning outcomes. In 2020, CAMFED was recognized with the Yidan Prize for Education Development for its work on girls' education.

CAMFED's intervention has evolved from one focused primarily on bursary support to girls, to a highly responsive model that addresses the multi-faceted barriers to school inclusion and learning among the most marginalized girls. It incorporates targeted financial and material support to cover direct and indirect school-going costs, and specialist support for children with disabilities. Young women school graduates operate as peer mentors or "Learner Guides" to deliver a life skills and wellbeing curriculum in schools. They are trained to spot indicators of a student's increased vulnerability to drop-out, for example, through changes in her attendance or engagement at school, and to alert the appropriate authorities. Learner Guides in turn benefit from the opportunity to acquire an accredited vocational qualification that provides a stepping stone to their further education and employment.

A core principle of CAMFED's intervention is that it operates in government school systems in full partnership with Ministries of Education, with the aim of ensuring the school system is able to recognize and better serve the often invisible needs of the most marginalized children, with a focus on girls. Its infrastructure for delivery is decentralized to community level, to support a locally responsive approach to the particular challenges young people face, recognizing that community-driven programs represent the most effective solution for reaching marginalized children in a sustained way, as the barriers to education for this group start well before the school gate. Importantly, CAMFED has set out to demonstrate that it is possible to scale up a community-driven approach to improve the education outcomes of marginalized children, countering the common perception that programs that go to scale often preclude the most marginalized because of the potentially high transaction and discretionary costs associated with this outreach.

Central to CAMFED's approach is the community-led process through which marginalized girls are identified to receive targeted support to meet their school-going needs. This process draws on a set of criteria that are grounded in government definitions of "vulnerability" as laid out by the relevant department of social welfare in each country. These criteria have been drawn up with and by communities, and cover the social background of girls (whether she is from a child-headed household, is affected by disability and so on) as well as her educational status (whether a girl has dropped out or is at risk of dropping out of school). This has led to a "marginality tool," operationalized as an "index" of 20 locally defined dimensions of marginalization, shown in the table below.

Marginality indicators identified by communities

1. A child whose parents/guardians cannot pay the school costs and so are often sent home or drop out of school.
2. A child living in a family that gets only one meal per day, or sometimes goes to bed hungry.
3. A child living in a household with very low income so that they cannot afford even the basic needs.
4. A child living with old relatives with no or little income, so the child has to earn income for the family.
5. An orphaned child living with guardians who is being neglected and not having all needs provided, including school costs.
6. A child taking care of sick or disabled parents, siblings or other relatives (which stops them going to school).
7. A child who lives in the street.
8. A child who lives in a household headed by a child.
9. A child who is the head of the household.
10. A child who is given a lot of work so that they don't have time to do their homework or they miss school.
11. A child whose guardian treats them unfairly compared to other children in the household in terms of work or provisions.
12. A child who spends a lot of time in church activities to the extent that she/he misses school.*
13. A child whose parents/guardians do not value education and so do not pay school fees and other school costs.
14. A child whose parents/guardians are sick or disabled so that they have very low or no income.
15. A child with a chronic illness or disability whose parents/guardians cannot afford the treatment and school-going costs.
16. A child with chronic illness/disability whose parents don't encourage them to go to school and so don't pay school-going costs.
17. A child living in a household with many children so that the parents/guardians cannot pay the school going costs.
18. A child who spends most or all of their leisure time working to make some money.
19. A child who does not have a permanent home and therefore often misses school.
20. A child whose parents/guardians are pressuring them to marry or drop out of school to get a job or work on the farm.

*This criterion was identified by communities concerned that some children were spending whole days and nights in church, which was leading them to miss large amounts of time in school.

In addition to its use in identifying girls likely to benefit from support, the index helps in outlining the distribution of needs across the target population. It has been integrated with other tools, including questions recommended by the Washington Group on Disability Statistics (http://www.cdc.gov/nchs/washington_group.htm), to achieve a nuanced understanding of the nature and degree of marginalization. A study conducted with a representative cohort in Tanzania and Zimbabwe in 2013 (CAMFED, 2013) found that while all students in the school communities experienced some degree of marginalization by virtue of their location in remote and under-served areas and the lack of, or low quality, school infrastructure, 62% and 68% of girls in the cohorts in Tanzania and Zimbabwe respectively were especially marginalized against this index (For comparison, in an analysis based on Grameen PPI, these girls achieved a mean score of 33.1).

The most common scenario in both Tanzania and Zimbabwe was “a child whose parents/guardians cannot pay the school costs and so is often sent home or drops out of school.” This scenario alone accounted for 35% of girls in the cohort in Tanzania at the baseline and 34% in Zimbabwe. According to the Grameen Progress Out of Poverty Index (PPI) (<https://www.povertyindex.org/>), the mean cohort member in Tanzania had a 78% likelihood of living in a household with an income of less than \$1.25 per day. Living in a household where the adults had a regular income was rare among marginalized girls, often resulting in difficulties paying for school-going costs. In both Tanzania and Zimbabwe, around half of marginalized girls were engaged in income-earning activity to contribute money to the household. This highlights the short-term opportunity cost for the households of children attending school and explains one important cause of drop-out from school.

Hunger was a common experience among the cohort students, a product of the prevailing levels of poverty. 60% of marginalized girls in Zimbabwe and 47% of those in Tanzania reported experiencing hunger on some or most days. Hunger can have many physical and psychological effects on young people that make learning difficult (<http://borgenproject.org/effects-of-hunger-on-education/>). Children experiencing hunger are more likely to have problems with memory and concentration. Hunger has been observed to cause depression, anxiety and withdrawal, all of which are obstructions to a child trying to focus on education. In addition, when hunger leads to malnutrition, children become more susceptible to illnesses, the development of the brain can be impaired and it can disrupt sleeping patterns, making a child too tired for a full day of school.

The loss of one or both parents was also associated with marginality, and was common among the cohort in both countries, especially in Zimbabwe. The death of her father and the associated economic fall-out was a significant factor leading to girls dropping out of school. Marginality was also associated with living in a family headed by a grandparent (or another elderly person) and with living in a female-headed household—both of which may be the consequence of the death of one or both parents.

Living with family members facing long-term illness or disability was something experienced by around half of marginalized girls in both countries. Long-term illness or disability will have immediate consequences for the economic welfare of most households, creating pressures to engage children of school-going age in income-earning activity. Another consequence for the children in these households is the need to provide the caring role for family members. The caring role is also a factor in larger households with many children or elderly relatives, a role often assigned to older siblings—particularly girls. For many marginalized girls, caring for family members was a regular, even daily, responsibility, and a common reason for missing school.

Many marginalized girls themselves had a disability. Around half of cohort students in Zimbabwe and a fifth in Tanzania reported having some kind of difficulty indicative of a disability. In many of the categories of disability (or difficulty), marginalized girls were more likely than their less marginalized peers to experience some level of difficulty, and the severity of difficulty tended also to be greater among them.

A subsequent study in 2018 (Surridge et al., 2018) of students at secondary school in Tanzania and Zimbabwe, and upper primary school in Zambia, confirmed the intersection of dimensions of exclusion and marginality with barriers to education. Girls identified as marginalized were more likely to be over-age for their school grade. They were also more likely to suffer from a high burden of chores (in Tanzania, 51% of marginalized girls compared with 8% of other girls). Marginalized girls felt less safe at school or traveling to and from school (in Zambia, 23% of marginalized girls compared with 14% of other girls), and had no encouragement from parents or caregivers to stay in school (in Tanzania, 19% of marginalized girls compared with 10% of other girls). Marginalized girls were also less likely to attend school regularly (defined as attending less than 85% of the time); in Zimbabwe, for example, this accounted for 81% of marginalized girls. Analysis of the intersection of dimensions of marginality found that students with a disability were likely to experience multiple barriers to education, though this multiple exclusion was not the exclusive experience of disabled children but the norm for the majority of girls—girls affected by the loss of one or both parents, and those living in a household without a regular income, for example, faced similar intersecting barriers.

In the 2018 study, 17% of girls in Tanzania and 15% of girls in Zimbabwe were identified as having some type of disability, with visual impairment the most commonly reported disability in both. These disability levels contrasted with official data: EMIS (Education Management Information System - school level data collected annually by governments) data in Zimbabwe gave a national rate of 1.08% for disability prevalence in secondary schools (both genders); in Tanzania the latest Basic Education Statistics Tanzania (BEST) survey at the time (2017) found the most prevalent disability was impaired vision, putting the prevalence at 0.2%. It is probable that there are several reasons for the discrepancy between the studies and government data, including differences in data-gathering tools, inadequacy of official data collection, and higher levels of marginalization among the target group. On a positive note, following this study the use of Washington Group questions has now been introduced at school level in Zimbabwe by ZIMSTAT (Zimbabwe National Statistics Agency).

Washington Group Questions

The Washington Group (WG) Questions are two sets of question (one short, one extended) developed to provide cross-nationally comparable, population-based measures of disability. Developed by the Washington Group on Disability Statistics, established under the United Nations Statistical Commission, they have been internationally validated and tested across low-, middle- and high-income countries. The WG questions are designed to be incorporated easily into surveys and censuses and provide a low-cost, easy-to-administer and analyze, method of gathering accurate data on disability prevalence to inform policy and action.

Effectiveness of the intervention

CAMFED's intervention has grown from small beginnings to become a substantial operation with many components. Size and complexity are no guarantees of excellence, however, and it is reasonable to ask how effective the intervention is and whether it delivers value for money. The intervention has in fact been subjected to a good deal of scrutiny, particularly as it has scaled up, partly as a result of donor requirements and partly from its internal commitment to good governance. Evaluations have focused on how successful the intervention has been in securing girls' continued attendance in school and becoming effective learners.

This section sets out the evaluation approach used to measure the effectiveness of the intervention. It presents evidence from a series of large-scale independent evaluations carried out over an eight-year period, 2013–2021, across three countries, with particular reference to school retention and learning outcomes. It also presents data on cost-effectiveness and draws attention to broader evidence suggesting that its expenditure on girls' education is a highly productive investment.

Evaluation approach

The evaluations took a quasi-experimental approach, tracking successive cohorts of students across randomly selected intervention and comparison schools. The underlying assumption was that a holistic intervention approach, incorporating targeted financial and material support alongside the "social" support delivered by Learner Guides, would lead to better retention and, ultimately, improved learning outcomes for marginalized girls in particular.

The evaluations were conducted in two phases: the first phase, from 2013–17, followed a cohort of 11,075 students at secondary school in Tanzania and Zimbabwe; the second phase, from 2018 to 2021, followed a cohort of 23,107 students at secondary school in Tanzania and Zimbabwe, and upper primary school in Zambia. At baseline each cohort was disaggregated according to the degree of marginality students faced, using CAMFED's marginality index. This allowed the evaluation to examine whether and to what extent the intervention reached the most marginalized girls, and to assess whether the impact varied according to a student's marginality status.

The tools to measure learning were developed and delivered in partnership with Ministries of Education and exam councils in all three countries, and marked by the relevant national exam board: this helped ensure buy-in, relevance and comparability. It also set the stage for the subsequent integration and adoption of components of the intervention into school systems nationally. In the first phase of evaluations (2013–2017), learning tests were developed using a national assessment tool as the base. In the second phase (2018–2021), the EGRA (Early Grade Reading Assessment) (https://earlygradereadingbarometer.org/pages/about_egra) and EGMA (Early Grade Mathematics Assessment) (https://pdf.usaid.gov/pdf_docs/Pnads439.pdf), open-source tools developed by RIT International for USAID, were used as a basis for the development of tests known as SeGRA/SeGMA. These used a framework of subtasks designed to increase in difficulty and test higher orders of learning among secondary school students, and unlike the (foundational level) EGRA/EGMA tests, were delivered solely in a written format. In Zambia, where the intervention supported upper primary school students to progress to and through secondary school, the SeGRA/SeGMA tests were used in a continuum with EGRA/EGMA style tests used at the lower grades.

The evaluation findings are detailed below. Significant improvements were identified in retention and learning across all groups experiencing different degrees of marginalization, who were reached by CAMFED's intervention. Importantly, these improvements were repeated in each successive tracked cohort.¹

¹Tracked cohorts:

2013–2015: 11,075 students in Tanzania and Zimbabwe followed for 18 months across two academic years, from Form 2 to Form 4
 - 2015–2017: 11,255 students in Tanzania and Zimbabwe followed for 12 months for a single year, as they transitioned from F3 to F4
 - 2017–2019 (A): 23,107 students in Tanzania, Zambia and Zimbabwe followed for 18 months. In Tanzania and Zimbabwe this tracked the transition from F2 to F4. The Zambia sample included two sets of students, progressing from Grades 5 to 7 and 7 to 9 respectively.
 - 2017–2019 (B): 7985 students in peri-urban districts of Tanzania followed for 18 months between forms 1 and 3.
 - 2019–2021: The Zambian students in cohort 2017–19(A) will be followed through to grades 9 and 11 respectively, as will the younger part of the 2017–19(B) cohort. The remainder of the 2017–2019 cohorts in Tanzania and Zimbabwe will be followed to assess post school outcomes and pathways but will not sit learning assessments.

Retention outcomes

Evaluation of the first phase (2013–2017) of the intervention in Tanzania and Zimbabwe (Morris et al., 2017) found:

- Marginalized girls supported by CAMFED in intervention schools were significantly more likely than their counterparts in comparison schools to have stayed in school to the end of lower secondary education. This was true for successive cohorts.
- The probability of a marginalized girl in a comparison school in Zimbabwe in Cohort 1, for example, dropping out of school was nearly three times as high (275%) as for a marginalized girl in an intervention school ($p < 0.001$).

These results were repeated in subsequent cohorts and in new geographies: evaluation of the 2017–19 period (Roland et al., 2020) found similar positive associations between the intervention and girls' retention and attendance in school:

- In Tanzania, retention of marginalized students was greater by 14% in intervention compared to comparison schools, a statistically significant value at the $p < 0.001$ level.
- Marginalized girls at supported schools were more likely to successfully transition from Form 1 to Form 2 than those at comparison schools.
- In Zambia, the proportion of marginalized girls attending school regularly (defined as in school $>85\%$ of the time) rose by 22.5% over an 18-month period.
- Children with disabilities were more likely to successfully transition to the next grade of education in intervention schools than children with disabilities in comparison schools.

Ropafadzo is 15 and lives in rural Zimbabwe. As a baby she suffered severe burns in an accident at home, resulting in a traumatic amputation of her right hand, which became worse through lack of medical attention. In addition to the physical challenges this caused, it severely affected her self-esteem, creating an additional barrier to inclusion in education. Ropafadzo was identified for support to attend secondary school, including access to specialist medical assessment. This resulted in Ropafadzo undergoing corrective surgery and prosthetic support. Importantly, Ropafadzo was connected to young women with similar experiences of disability: they included Primrose, who had suffered burn injuries as a child and was herself supported to complete her education by CAMFED. Ropafadzo called this connection "my first turning point".

Analysis by the REAL Center (Research for Equitable Access & Learning) at the University of Cambridge, based on data from the first (2013–2017) evaluation phase in Tanzania (Alcott et al., 2020), found:

- Accounting for household wealth, marginalized girls in supported schools were 18% less likely to drop out compared to similarly disadvantaged girls in comparison schools; those receiving financial and material support were 31% less likely to drop out, an improvement that was similar across different degrees of disadvantage and levels of disability.
- Learning levels and learning support matter: drop-out was reduced for everyone, but less significantly for weaker learners, who had higher initial levels of dropout (improving from 20% to 16% vs. 8%–3% for stronger learners).

Learning outcomes

In the first evaluation phase (Morris et al., 2017), marginalized girls in intervention schools demonstrated significantly larger learning gains than their counterparts in the comparison schools in both Math and English, repeated in successive cohorts over the intervention period. Specifically:

- In Tanzania, learning gains by marginalized girls at intervention schools in both Math and English were statistically significantly greater than those among marginalized girls at comparison schools. For Math, these equated to a Difference in Difference (DiD) of +16.62 marks (an effect size of 1.06, measured in standard deviations) for Cohort 1 and a DiD of +13.2 marks (an effect size of 0.65) for Cohort 2 (A difference-in-difference approach compares the average change over time in the outcomes of the intervention group to the average change in those of the comparison group, in order to calculate the effect of the intervention).
- In Zimbabwe, where partner communities were affected by severe droughts and flooding over the period, overall gains were lower than seen in Tanzania (Zimbabwe experienced a series of environmental shocks over the period, which badly affected target communities including through school closures) but reflect significant differences between gains achieved by marginalized girls in intervention and comparison schools. For Math, these equated to a DiD of +1.12 marks (an effect size of 0.14) for Cohort 1 and a DiD of +1.32 marks (an effect size of 0.34) for Cohort 2.

Additional analysis conducted by the REAL Center (Alcott et al., 2020) found that all girls, including those with disabilities (as above, 17% of the cohort at baseline), improved their learning against comparison groups: *"Once supported by the program, we find that marginalized girls significantly increased their English and Math test scores over the period of two years, regardless of physical or mental learning difficulties. For example, on average girls with moderate/severe difficulties improved their Math scores from 11 to 28 points out of 100. By comparison, equivalent marginalized girls not supported by the program did not improve. In addition, it is worth noting that marginalized girls with physical or mental difficulties supported by CAMFED improved their learning at the same rate as marginalized girls who did not report any difficulties."*

This finding is illustrated in the following figure taken from the REAL Center’s paper showing absolute gains in Math test scores for girls according to extent of disability.

There was also a correlation between supporting girls’ academic self-esteem and improvements in their learning, as shown in the figure below. Academic self-esteem was measured at baseline for each cohort using a bespoke “Attitudes to Learning” questionnaire tool, which explored students’ beliefs about their abilities and academic enjoyment. While at baseline girls’ learning differed according to their level of self-esteem (where girls with low self-esteem scored on average 11 points in Math, vs. 13 points scored by those with higher self-esteem), learning benefits occurred across the entire self-esteem scale.

Evaluation evidence, measured through the Attitudes to Learning tool, confirmed that the Learner Guides and life skills curriculum had a statistically significant ($p < 0.01$) impact on girls’ enjoyment of school and confidence in their academic progress in both countries (Morris, 2016). More than 95% of marginalized girls in both Tanzania and Zimbabwe reported they felt more positive about their future and more able to shape their life goals.

The independent second phase evaluation, tracking subsequent cohorts across Tanzania, Zambia, and Zimbabwe, found repeated improvements in girls’ learning (Roland et al., 2020):

- In Tanzania, there were statistically significant gains for marginalized girls at intervention schools with DiD increases over scores for marginalized girls at comparison schools of 6.7 pp ($p < 0.001$), reflecting an effect size of 0.71. English scores showed statistically significant DiD gains of 3.3 pp ($p < 0.01$) for marginalized girls at intervention schools, which represents a standardized effect size of 0.19.
- In Zimbabwe, Math gains for marginalized girls were significantly positive, with a DiD score of 7.0 pp ($p < 0.001$), representing an effect size of 0.35. The DiD increases for all students (girls and boys, marginalized and less marginalized) were significantly greater than for all students at comparison schools.
- In Zambia, Math gains for marginalized girls at intervention schools were significantly greater than for their peers at comparison schools. Those progressing from grade 5 to 7 achieved scores with a significant DiD of 5.8 pp ($p < 0.001$). Marginalized girls progressing from grades 7 to 9 at intervention schools achieved a positive DiD of 6.5 pp ($p < 0.001$).

In Tanzania, where the intervention had been replicated from scratch in new districts, independent evaluation after approximately 18 months of intervention found (Flett et al., 2020):

- Gains in English literacy for marginalized girls were larger in intervention schools versus comparison schools and showed a statistically significant ($p < 0.003$) DiD of 4.6 pp (effect size: 0.3) for girls moving from Form 1 to Form 2, and a significant DiD of 4.2pp ($p < 0.001$) (effect size: 0.26) for the combined cohorts of girls moving from Form 1 and 2 and from Form 2 to 3.
- Math skills of marginalized girls moving from Form 1 to Form 2 in intervention schools improved at a greater rate than those in comparison schools. Their DiD numeracy gains were statistically significant ($p < 0.008$) 3.0 pp (effect size: 0.27). Numeracy gains for the combined Form 1 and Form 2 cohorts were 2.8 pp, ($p < 0.002$), reflecting an effect size of 0.20.

These latter results have important implications for the replicability of the intervention; they demonstrate that it is possible to introduce an intervention of this nature to new areas and achieve meaningful improvement in the education outcomes of marginalized girls within a reasonable timeframe.

Cost-effectiveness of the intervention

It is one thing to evaluate the effectiveness of an intervention in terms of the impact on young people's education outcomes; it is quite another to demonstrate whether it is cost-effective in achieving those outcomes. This kind of information is vital in enabling policymakers to consider how resources can be best deployed to address the educational needs of all children.

Cost-effectiveness is an approach to calculating how much impact on education outcomes an intervention such as CAMFED's achieves relative to the inputs invested in it. Common approaches to cost-effectiveness analysis calculate the average cost associated with the average improvement in learning. However, this ignores the additional resources that are likely to be needed to support marginalized groups who face multiple forms of disadvantage.

The REAL Center conducted a detailed cost-effectiveness analysis (Sabates et al., 2020) drawing on evaluation data and financial information from CAMFED's intervention in Tanzania. Importantly, this cost-effectiveness analysis incorporated an equity lens in estimating the additional unit cost of reaching marginalized children relative to the increase in learning for these groups resulting from the intervention, such that disparities in learning outcomes are narrowed.

The findings of this cost-effectiveness analysis were that, for all children, the impact of the intervention was equivalent to 1.7 extra years of schooling per \$100 spent. Taking equity considerations into account, the value of the intervention was equivalent to 2 additional years. The overall conclusion was that interventions of this nature that target the most marginalized (in this case girls marginalized by gender, geography, poverty, and disability) address the needs of all: *"inclusive education systems will function for everyone if they function for the most marginalized"* (Sabates et al., 2018, p. 3). This conclusion has important implications for policymakers in the drive to achieve system-wide inclusive and equitable quality education. It helps to dispel the myth that it is prohibitively costly to address the educational needs of children who are most marginalized.

A productive investment? The wider outcomes

Arguably one of the most important outcomes of the intervention lies in the cohorts of girls who graduate from secondary school, in terms of what they go on to do and become. The benefits of girls' education are well documented in the ensuing improvements in health and welfare. What is perhaps less conspicuous in the evidence base to date is the impact of an empowering educational experience on girls' longer-term prospects beyond school.

In the case of CAMFED, there has been a proactive approach to ensure continued contact with marginalized girls who received support through their education, thus opening up the opportunity to track their life choices and outcomes. Data shows that these young women marry and have children later than their peers (Binkley, 2019): in Zambia, for example, a survey of CAMFED Association members found that only 18% of women had married, compared with a national average of 55% for the same age bracket (Good, 2019); in Tanzania CAMFED Association members start a family on average 2.5 years later than their peers (Binkley, 2019).

Many of these young women have gone on to join the CAMFED Association, the alumni network founded by the first young women to complete their secondary education with CAMFED's support, which by early 2021 numbered 178,000. In their transition from school, the majority have embarked on some form of entrepreneurship as the stepping stone to formal employment, self-employment or further education. An independent evaluation of CAMFED's impact on the lives of young women in the initial post-school phase, recorded "significant impact" in a number of dimensions: increased entrepreneurship, savings and household consumption; decision making power; access to further education and business growth; and, significantly, in their burgeoning philanthropy (Binkley, 2019).

Empowered by their own shared experience of overcoming poverty and inequality to get an education, these young women are united in their determination that no other girl should face the same hardships and are stepping up in remarkable ways to support the education of other marginalized children. Each member of the Association is assisting, on average, three other girls in her community to go to school; an extraordinary multiplier. Pulitzer prize-winning author Nick Kristof describes it as *"a perpetual motion machine... a virtuous cycle that grows over time"* (<https://www.nytimes.com/2020/11/21/opinion/sunday/charitable-holiday-gift-guide.html>).

Naomi is one such young woman in Zambia, who took up the role of Learner Guide and has recently been awarded a BTEC (Business and Technology Education Council) qualification:

I am passionate about supporting girls and young people to stay in school and reach their potential, so I wanted to improve my ability to do this as a Learner Guide. As a Guide I offer mentoring and psychosocial support to help learners improve and complete secondary school, which is crucial to their future plans. My facilitation skills have been enhanced so that I am able to deliver sessions more effectively and better support learners.

The BTEC helped me to develop my interest in becoming a teacher and I have learned how to work with learners in and out of school. It has sharpened my facilitation skills, helping me to deliver higher quality sessions. The BTEC has strengthened my personal and professional skills, like problem-solving, responsibility, teamwork, organisation, time management, self-discipline, commitment, and patience, just to mention a few.

I am going the extra mile because I look for more work and volunteer my strength whenever duty calls. I often support my fellow Guides through delivering extra sessions when I am available. Through this I have learnt a lot from other people's experiences and gained more exposure to teaching, which will help me in my career ambitions.

I am a role model in my community because I demonstrate confidence and leadership. I communicate and interact effectively with everyone, always showing respect and concern for others. I am knowledgeable, well-rounded, honest and have a positive attitude. In my community, I lead activities to promote girls' education and support my fellow women. Through my willingness to volunteer and give back to my community, I am a positive role model. I conduct community sessions with youths, following the My Better World curriculum; I sensitise them on the dangers of early marriage and early pregnancies, and teach them about sexual and reproductive health. I want to help learners to stay in school and complete their education.

Thanks to the skills and confidence I have developed through volunteering as a Learner Guide and undertaking the BTEC, I am now a public speaker, frequently invited to speak at different platforms on issues concerning the wellbeing of youths.

Naomi, like many other Learner Guides, is on track to pursue formal teacher training ultimately to take up a place in the teaching profession, toward redressing the gender imbalance in teachers posted to rural schools. From an intimate understanding of what it means to be marginalized, an understanding that is embedded in their own experience, these young women can surface the often-hidden needs of the most marginalized children, especially those affected by disability, and ensure their needs are sensitively and effectively addressed. They are now at the vanguard in communities in reaching out and assisting marginalized girls.

Importantly, CAMFED itself is now largely staffed and led by women who themselves received support from CAMFED to attend school and who are members of the CAMFED Association. This network of women leaders is at the forefront of designing and delivering programs, and at the table with policymakers to advocate for the system-wide adoption of strategies that are effective in improving the outcomes of marginalized young people.

Conclusion

Education is the unquestioned route to individual betterment and social improvement: access to high-quality, appropriate education is an essential prerequisite for an equitable and prosperous society. Regrettably, many countries lack such universal access and progress toward it is unacceptably slow, where it has not stalled entirely. As documented above, gross inequalities in access to education persist, particularly in respect of gender, poverty and disability.

This situation can, and should, be addressed. The arguments against doing so appear to revolve around the twin obstacles of affordability and feasibility: extending high-quality education to all children is prohibitively expensive and, in any case, we do not know how to do so effectively. The purpose of this chapter is to challenge these arguments and, by presenting evidence, refute them. Not only do the reasons for inaction not stand up to close scrutiny, but we can demonstrate, on the basis of large-scale, system-level evidence, that quality education is *already being provided* to girls marginalized by gender, poverty and disability. Moreover, the cost of these interventions is modest and, arguably, an investment that more than repays the initial outlay. We have shown that the initial cost yields substantial extra years of schooling. When to this are added the manifold other benefits that accrue—better employability, increase in entrepreneurial activity, reduction in early marriage and infant mortality—the educational expenditure outlined here is a highly productive investment.

The global community and many national governments have committed to the imperative of universal education. This means quality education for all children—regardless of gender, poverty or disability. If the commitments are genuine and we know what needs to be done and that it is affordable, the case for urgent, comprehensive action is unassailable.

Introduction

This chapter provides an overview of inclusive education for deaf learners with reference to how this concept has been differentially defined by some deaf advocacy organizations and inclusive and special education advocates, and operationalized by governments. Inclusive education is often viewed in terms of disabled children's educational placement in a regular school, instead of governments hosting separate systems for regular and special schools (Kayess and Green, 2017). In an inclusive classroom, all children receive instruction by primarily the same teacher (Florian and Spratt, 2013). In Canada and elsewhere in the world, the movement toward inclusive education has usually meant a focus on disabled children's integration, or proximity to nondisabled peers (Allan, 2008).

However, this focus on children's physical presence in the classroom frequently overlooks the issues of deaf children's participation and social and academic development. For most deaf learners, the main areas of need relate to language development and communication with peers and teachers. Deaf individuals are at high risk of language deprivation due to chronic lack of full access to a natural language in early childhood (Hall et al., 2017). Deaf advocacy organizations have long argued that these needs are best met in deaf schools where a natural sign language is the medium of instruction and a subject of study, and a written/spoken language is also learned. In fact, as past World Federation of the Deaf presidents Kauppinen and Jokinen (2014) have argued, bilingual education for deaf learners is not special education but part of an inclusive education system. However, this type of bilingual education is still very rare. Schools for deaf learners have also often entailed children's social and identity development through participation in a group of peers who share the same language and who benefit from access through visual and, in the case of deafblind children, tactile modalities. Consequently, the drafting and ongoing interpretation of international statements involving disability rights in education, such as the Salamanca Statement and Framework for Action on Special Needs Education (UNESCO, 1994) and the 2006 United Nations Convention on the Rights of Persons with Disabilities (UNCRPD) (United Nations, 2006), have been sites of both triumph and struggle for deaf community advocates (Snoddon and Murray, 2019).

The following sections of this chapter discuss some policy issues and problems with practical implementation and ideologies of inclusive schooling for deaf learners. In many ways, these problems are rooted in attitudinal and systemic barriers to inclusion, including the predominance of a special education model of service delivery, that have been identified by other scholars (Slee and Allan, 2001). However, inclusive education advocates may also need to give greater consideration to the primacy of natural sign languages and a bilingual model of teaching and learning that affords learner congregation with other children and adult signers, including teachers.

Are deaf learners exceptional?

Among advocates for deaf bilingual education, there are perceived to be multiple lines of thought regarding the interpretation of inclusive education. In part, these differing perspectives may be rooted in deaf people's relationship with disability. Deaf people have long struggled against their ongoing classification and management according to a medical model of disability as defective individuals in need of rehabilitation. In response, many deaf community advocates have disputed the notion that deaf people are disabled in the sense of a medical model of disability; rather, as sign language users, deaf people are part of a vibrant community and a linguistic and cultural minority (e.g., Lane, 2005). This position is buttressed by scholarly consensus regarding the complex linguistic organization of sign languages and by research in deaf histories, social organizations, ontologies, and epistemologies (Kusters et al., 2017).

In some circles, there is now more recognition of a social model of disability, which states people with impairments are disabled by society (Barnes, 2019), and also more recognition of a human rights model of disability that underpins the UNCRPD (Degener, 2016). The human rights model is a broad, rights-based model of disability that values impairment as part of human diversity (Degener, 2016). Other scholars have employed a capability approach and social relational model of disability in analyzing deaf childhoods (Snoddon and Underwood, 2014). This sociological model attempts to account for the complexities and diversities

in the lives of deaf children and seeks to support deaf children's freedom to achieve their full potential as members of deaf and hearing communities. Scholars have also contrasted a cultural model of disability with the aims of deaf communities (Snoddon and Underwood, 2017). This ongoing theorizing and evolving understanding of disability recognizes that deaf people have multiple identities, including disabled identities. In addition, since deaf people are explicitly recognized as rights-bearers only in disability legislation, deaf advocates have taken a pragmatic approach in utilizing this legislation to lobby for sign language rights (De Meulder and Murray, 2017; Snoddon, 2009). Thus, deaf advocacy and academic circles have become more accepting of a dual-category status of deaf people as both disabled and members of linguistic minorities (De Meulder and Murray, 2017; Ladd, 2003).

During participation in the UNCRPD drafting process, the World Federation of the Deaf sought "the right to be different" as a fundamental principle of the Convention (Kauppinen and Jokinen, 2014). Deaf and deafblind people are mentioned in the UNCRPD more than any other disability group (Wilcox et al., 2012), notably in Article 24, which deals with education. Section 3 of Article 24 outlines some measures related to deaf learners which states parties must take, including:

- (b) Facilitating the learning of sign language and the promotion of the linguistic identity of the deaf community;
- (c) Ensuring that the education of persons, and in particular children, who are blind, deaf or deafblind, is delivered in the most appropriate languages and modes and means of communication for the individual, and in environments which maximize academic and social development.

The above reference in section 3(c) to "environments which maximize academic and social development," particularly for deaf, blind, or deafblind children, has been taken to mean that the UNCRPD sanctions bilingual deaf schools (Arnardóttir, 2011; Murray et al., 2018). However, as discussed further below, this notion continues to be challenged by some inclusive education advocates who view this type of setting as "segregated." Scholars have also asserted that there is a legislative history in the UNCRPD of a "sensory exception" to the principle of "full inclusion" of all children in a regular neighborhood school. The "sensory exception" recognizes the right to learning environments where deaf, deafblind, and blind children learn with their peers (Murray et al., 2018). This exception is visible in the provisions of Article 24.

However, stating that deaf learners are the exception to the rule of a model of inclusion that is focused mainly on placement and that inclusion can be measured in degrees of proximity to a nondisabled center is different from asserting that bilingual schools for deaf learners form part of an inclusive education system. The two propositions follow different definitions of inclusion, with the former oriented to a needs-based approach that gives more consideration to the education and social needs of individual children and the latter to a more conceptual, rights-based approach to inclusion (Hall, 2002; Snoddon and Murray, 2019). Additionally, the notion that deaf learners have a special status creates a tension vis-à-vis both the universalizing claims of some inclusive education advocates and the proponents of special education based in a deficiency model who have long held sway in deaf education. A focus on deaf learners' exceptional status may overlook commonalities between deaf learners and other learners that can inform an understanding of inclusion.

A segregated separate school?

In 2016, the CRPD Committee issued General Comment No. 4 on Article 24 of the UNCRPD. The General Comment is intended to explicate and provide practical orientation for the implementation of the rights outlined in Article 24 (Murray et al., 2020). However, several deaf scholars have disputed General Comment No. 4's interpretation of inclusive education and Article 24 (Murray et al., 2018, 2020). Section 11 of the General Comment states, "Segregation occurs when the education of students with disabilities is provided in separate environments designed or used to respond to a particular or various impairments, in isolation from students without disabilities" (emphasis in original). For many observers, this definition describes deaf schools and places them in direct opposition to inclusive education. For example, Kayess and Green (2017, p. 59) write that placement in a neighborhood school with nondisabled peers must be the "default" position in inclusive education. Deaf scholars have charged that this definition is not in keeping with the legislative history of Article 24 and that the views of deaf advocacy organizations were not sufficiently considered in General Comment No. 4 (Murray et al., 2020).

An unspoken consideration is whether the foremost construction of a school for deaf learners is based only or mainly on disability or impairment. This basis ignores the cultural and linguistic identity of deaf communities or at least makes this identity subservient to a disability inclusion agenda. Murray et al. (2020) note that General Comment No. 4 conceives of sign languages in terms of assistive technology and accommodations for communication impairments, and this conception militates against an understanding of deaf learners as bilinguals with bilingual education rights like members of any other linguistic minority. Moreover, a prohibition of disabled people's congregation and affiliation seemingly takes a stigmatizing view of disability instead of recognizing what is positive, powerful, and productive in disability and in other shared social identities and life experiences (Hall, 2002). In the face of systemic oppression, deaf communities' struggle to recruit and train more signing deaf teachers of deaf learners finds strength in the advocacy efforts that are nurtured through deaf people's congregation and identity development (Hall, 2002; Snoddon, 2021b).

As Hall (2002) notes, the concept of "full inclusion" is a reaction to the ongoing history of educational exclusion and special education, which continue to oppress disabled learners. Deaf education systems are largely special education systems run by non-deaf professionals with a vested interest in maintaining the hegemony of oralism (Branson and Miller, 1993). This is evident in the discrimination practiced by teacher-of-the-deaf education, which has long enacted barriers to enrollment and licensure for signing

deaf candidates (O'Brien, 2021; Snoddon, 2021b). Today, however, teacher-of-the deaf education and professional practice are often geared toward the rehabilitation and assimilation of deaf children in a neighborhood school rather than the maintenance of deaf schools that support deaf learners' congregation and bilingual learning. This is seen in the widespread implementation of cochlear implants without sign language learning as the universal standard of care for deaf children in Western nations, and the educational mainstreaming of deaf children as a main component and goal of this process (Holmström and Schönström, 2017; Komesaroff, 2007; Mauldin, 2016). In this way, special education for deaf learners has appropriated inclusion discourses "in order to maintain unreconstructed notions of schooling and educational defectiveness" (Slee and Allan, 2001, p. 174). For many deaf advocates, full inclusion is often perceived as synonymous with the loss of sign language vitality and community institutions. This perception is supported by the current state of deaf education in Canada.

Closing deaf schools

Across Canada, the closure of schools for the deaf has meant the loss of educational environments and personnel to fulfill the right to sign language-medium education. When the R.J.D. Williams School for the Deaf in Saskatoon, Saskatchewan closed in 1991, the provincial government chose to focus on the integration of deaf students in spoken-language classrooms (Snoddon, 2009). The school closure led to "the exodus of deaf teachers and teaching assistants and the diminishment of a vibrant deaf community" (Weber, 2020, p. 33). It also led to several human-rights complaints and legal judgments concerning families with deaf children who were unable to receive an education in sign language (Snoddon, 2009). However, none of these legal decisions led to the restoration of a school for the deaf or the broad implementation of American Sign Language (ASL) learning environments in the province. In 2016, the Saskatchewan child advocate released a report concerning the death in custody of 16-year-old Dylan Lachance, an Indigenous deaf and language-deprived youth who was unable to communicate with staff responsible for his care and died "of acute bronchopneumonia with associated sepsis" (Langenegger, 2016; Pringle, 2016). In Newfoundland, where the provincial school for the deaf closed in 2010, 9-year old Carter Churchill reportedly receives one-and-a-half to 2 h of instruction in ASL every seven school days (Lord, 2019). Carter's parents filed a human rights complaint in 2017 and subsequently sought a hearing in regard to their son's lack of access to an education equal in quality to that received by nondeaf students in Newfoundland (McKenzie-Sutter, 2019). Carter's situation has led to another provincial child and youth advocate report concerning deaf education, which is as lacking in practical solutions in its findings and conclusions as the report from Saskatchewan (Kavanagh, 2020).

While Kayess and Green (2017) argue that maintaining regular and special school systems results in fewer resources and that phasing out special schools will mean more resources for inclusive schools, this assertion is not borne out by what transpired in Canada when deaf schools were closed. Rather, following deaf school closures, there are minimal or nonexistent resources to support deaf children who benefit from sign language; this point underscores how inclusive education is seen to complement government austerity measures as well as oralism (Snoddon and Underwood, 2017). Deaf advocates from other countries also report the loss of sign language learning environments and a consequential decline in sign language and community vitality (De Meulder et al., 2019; Goico, 2019). Goico (2019) reports on the implementation of inclusive education in Iquitos, Peru, where individual deaf children are placed in regular classrooms without sign language support services. This phenomenon has triggered language shift from the Peruvian Sign Language used by deaf adults who attended special schools to "homesigns" invented by deaf children and youth who have little or no access to a natural sign language or spoken language at home or school.

Some inclusion advocates view providing a sign language interpreter as a solution for deaf learners' language and communication needs in a regular classroom (Russell and McLeod, 2009). However, Article 24 of the United Nations UNCRPD does not refer specifically to sign language interpreters (instead, these are covered in Article 9, which deals with the accessibility of public facilities). Rather, Article 24(4) requires governments to "take appropriate measures to employ teachers, including teachers with disabilities, who are qualified in sign language." Deaf advocates sought to ensure that for deaf learners, the scope of the rights contained in Article 24 is direct instruction in sign language from signing teachers (including deaf teachers) and alongside deaf peers, in addition to opportunities to study sign language as a school subject (Kauppinen and Jokinen, 2014). Although an interpreter is an important part of a range of educational options that should be available to deaf learners, this is not sufficient to ensure an inclusive education since providing an interpreter does not mean that students receive the same quality of instruction as nondeaf learners or enjoy the same opportunities for social development (Russell, 2021; Russell and McLeod, 2009; Snoddon and Murray, 2019).

However, some countries, such as Belgium, maintain deaf schools that are markedly poorer in quality than regular schools and do not follow the government curriculum (De Meulder and Murray, 2021). In keeping with the overrepresentation of minority children in special education, many of these schools host a higher proportion of immigrant children and children with multiple impairments. This illustrates the pervasiveness of a special education orthodoxy in systems seeking to be bilingual and inclusive. However, Moges (2020) argues that the history of the segregation of schooling for white and Black children in the USA led to better sign language outcomes for Black deaf children and the flourishing of Black American Sign Language (Black ASL) at Black deaf schools, since schools for white children were often oralist. This paradox of "Black deaf gain" also occurred in South African schools for Black deaf children. Following the dismantling of apartheid, which coincided with oralism for white deaf children, white children reported learning sign language from Black deaf children (Brown, 2020). Borrowing from Crenshaw's (1989) concept of intersectionality, this phenomenon makes visible the multidimensionality of experiences for people who are multiply oppressed by racism, sexism, and other systems of discrimination, and the importance of shared identities for deaf children's flourishing.

Where is a way forward?

While inclusive education advocates may often prioritize a regular school setting and a vaguely defined, aspirational set of resources to be provided in this setting, this often fails to provide meaningful guidance to governments or policymakers who seek to meet the needs of deaf learners. It is insufficient to claim that existing inclusive and deaf education systems are not truly inclusive and that continual educational transformation is needed while the resources that enable bilingual education provision continue to be stripped away. There is an ongoing struggle to maintain deaf schools and an array of placement options for other students that support language, culture, and identity development (Hall, 2002). Deaf advocates may thus perceive that they inhabit a hostile terrain beset by both inclusive education proponents and special education professionals.

Murray et al. (2020) describe a range of models of inclusive education for deaf learners. These include longstanding deaf schools that provide bilingual education in one or more natural sign languages and written/spoken languages while following the government curriculum. These schools typically employ a high proportion of deaf teachers and administrators, and sometimes provide sign language classes for parents of deaf children. The Maryland School for the Deaf employs the inclusive practice of allowing non-deaf siblings of deaf students to attend school on Mondays and Fridays (Fevlado, 2015). Deaf schools can also support deaf learners enrolled in regular schools and enable a model of simultaneous enrollment where students can attend classes at both a deaf and regular school (Murray et al., 2020). This model may especially but not only benefit deaf learners in rural areas, who live farther away from a deaf school.

Co-enrollment models involve the provision of a bilingual program at a regular school with deaf and hearing teachers and learners. These models can take various forms, including deaf student enrollment in both regular and separate classes at the same school, or deaf learners' attendance in a separate bilingual class inside a regular school (Murray et al., 2020). However, in practice deaf teachers in these programs may often have a subordinate role and deaf learners are marginalized, since hearing students are rarely expected to learn sign language (Murray et al., 2020; Snoddon, 2021a). These issues point to how inclusion is an ongoing process and an opening for dialog, rather than closure (Slee and Allan, 2001).

In seeking to enact inclusive education, deaf communities and educators need new activism, research, forms of schooling and teacher education, and reflexivity (Slee and Allan, 2001). In their overview of the current state of education for deaf students in Sweden, which was previously on the vanguard of the deaf bilingual education movement, Schönström and Holmström (2021) argue that a bilingual approach is even more relevant today than in the past. This approach needs to account for the broad linguistic repertoires of deaf students that may include spoken languages, and provide ongoing support to educators in terms of bilingual teaching practices (Schönström and Holmström, 2021).

In many countries, an education in sign language is frequently seen as the last resort, after deaf students fail to benefit from cochlear implants and integrated placements in regular schools. Inclusive education for deaf students should not only respect their educational rights as outlined in Article 24, but also affirm their identities as members of signing communities.

Introduction

In the past, dominant discourses about autism in education contexts have largely been deficit-based and perpetuate marginalization, stigma, and dependence (Urbanawicz et al., 2019). This has led to “normalizing” students with disability to enable them to fit into existing educational structures, settings, and practices rather than implementing systemic changes that enable teachers to adjust their practices to cater to the diversity of learners and support inclusion of all students (Bajada et al., 2021; Liasidou and Ioannidou, 2021; Shume, 2020). The consequences of stigma and marginalization for the autistic population are well documented (Botha and Frost, 2020) and are seen from an early age. It is estimated that 71% of autistic adolescents meet criteria for mental health conditions (Hull et al., 2021); forming a positive autistic identity has been related to lower rates of depression and anxiety (Cresswell and Cage, 2019; Shakes and Cashin, 2019) and improved self-esteem (Cooper et al., 2020). In this article the research team, consisting of four female researchers who identify as autistic and three researchers who do not, used collaborative autoethnography (Chang et al., 2016) to reflect on how educational experiences in the school years may nurture or erode identity for autistic girls, and how this can inform more inclusive educational support for this group of learners.

Autism is best known for early independent descriptions provided by Kanner (1943) and Asperger (1944). Since then, there has been debate about what autism is, and who can be considered autistic with the ongoing evolution of diagnostic criteria reflecting this debate. One important event in the expansion of the spectrum of autism was Wing's (1981) paper *Asperger's Syndrome: A Clinical Account* based on Asperger's original accounts. This helped raise awareness that autistic people could be highly verbal and have normal to superior IQs. Since then, there has also been increasing recognition that women can be autistic, and that autism in females may not present in the same way as in males. It is timely to hear from autistic women about how their school experience impacted on their identity.

Education and identity

While dictionary definitions of identity are not unified (Lopes, 2018), the Cambridge Dictionary (2022) defines identity as “the fact of being, or feeling that you are, a particular type of person ... the qualities that make a person ... different from others”. Importantly, Lopes (2018) defines identity as:

Identity is concerned largely with the question: “Who are you?” which can be broken down into our sense of self, or the global understanding a person has of themselves; including roles, attributes, skills, abilities, disabilities, behaviors, and associations that we consider most important to us. Identity relates to our basic values that dictate the choices we make, and these choices in turn reflect who we are and what we value.

In comparison, Rachel – an autistic woman and co-author of this article – described identity in the following way:

I see identity as the core of who you are as a person, your fundamental beliefs and temperament. This is separate from what you do and how you act, but it informs these things ... I see identity as being separate from role, but the two can sometimes overlap. For example, someone may take on roles as a parent, as an employee, and as a customer, but they may only consider “parent” to be part of their identity.

Erikson’s (1968) influential psychosocial model suggests that identity development is the product of both psychological and social processes and that it is an ongoing, active process that occurs across the lifespan. Although Erikson recognized the importance of social influences, his work extended the works of psychoanalysts including Freud, and focused on ego and personal identities. Ego identity includes those traits and characteristics that are often unconscious (Ehala, 2018). Personal identity includes the conscious cognitive processes used to understand the world and who we are, as communicated through our values, attitudes, and goals (Kerpelman and Pittman, 2018).

Critical to notions of identity is that “everybody has a sense of self or sense of personal identity” (Lopes, 2018). This sense of identity is fluid and evolving based on the person’s experiences in different contexts and in the roles they have in their lives (e.g., family, school, social relationships, abilities and disabilities; Lopes, 2018), reinforcing the significant role schools have in nurturing a strong and positive sense of identity for all learners across their childhood and adolescence. In addition to these ideas, the concept of intersectionality (Crenshaw, 1991) is useful to understand personal and social identity configurations and illuminate “the distinctiveness of experience that comes from how one is treated as a member of multiple, major social groups” (Shmulsky and Gobbo, 2019, p. 648). Intersectionality is a framework for understanding how social identities such as gender, race, ethnicity, social class, religion, sexual orientation, and ability overlap with one another and with systems of power that oppress and advantage people. Consideration of these overlaps supports our understanding of the data reported in this chapter, interpretation of meaning and generation of new ideas to support inclusive practices in schools for autistic girls and nurture their developing identities.

Autism and girls

Until recently, there was a disproportionate ratio of males with a diagnosis of autism in comparison to females, with ratios of 4–5 males to every one female diagnosed (Milner et al., 2019). Current research has challenged these ratios and produced evidence for underdiagnosis in girls and a biased understanding of the spectrum and methods of diagnosis based on a male model of autism (Milner et al., 2019). Recent qualitative research into autistic female experiences reinforces these issues, with many describing how their autistic tendencies went underdiagnosed to late adolescence or early adulthood (Milner et al., 2019). These experiences have highlighted how autistic females often use a technique described as “masking” to help them fit in and hide their autistic tendencies (Bargiela et al., 2016; Cage and Troxell-Whitman, 2019; Hull et al., 2017; Milner et al., 2019).

Masking or camouflaging autistic behavior occurs in response to external pressure to appear “normal”. This pressure can be direct – through interventions to address perceived deficits – or indirect, with masking acting as a protective mechanism against stigma and discrimination (Cage and Troxell-Whitman, 2019; Hull et al., 2017). The term “masquerading” has also been used to describe how feelings, emotional reactions, and stress are masked in the school environment (Carrington and Graham, 2001). Multiple studies examining the causes and consequences of masking have been carried out in recent years and there is a growing body of evidence demonstrating the adverse mental health outcomes associated with masking autistic behaviors (Cage and Troxell-Whitman, 2019; Hull et al., 2021; Schneid and Raz, 2020). While studies looking into the masking behaviors of autistic females suggested they proved successful in helping them try to fit in socially, it was only a short-term, superficial way of coping and masked their feelings of unhappiness, anxiety, and loneliness (Cage and Troxell-Whitman, 2019; Hull et al., 2021; Schneid and Raz, 2020). We suggest that masking or masquerading behavior is therefore an important consideration in this discussion because the social influences at school influence identity development. We also suggest that, given the historical gender bias in autistic research, it is important for us to look at and investigate the autistic female experience in more depth.

Autistic voice

An inclusive research approach assumes that the lived experiences of autistic individuals should inform future planning in education (Lawson and Carrington, 2021). Recently there has been a growth in research that engages the autistic community as research partners (Pellicano et al., 2019). Autistic educator, Trudy Bartlett, suggests that listening to the voices of people on the autistic spectrum can be transformational, stating:

As a student myself I had a challenging time in high school. I was seen as a naughty, disruptive student. I was often issued consequences like detentions and even put on behavior monitoring programs because of my behavior in class ... Almost all of my teachers didn't ever ask me what was going on in my world, what they could do to help me learn, how could they make adjustments to help support me in the classroom ... They constantly told me I was not good academically; they told me that I wouldn't be successful when I finished school.

Bartlett and Carrington (2021: 55).

Engaging the autistic community by providing opportunities to hear the autistic voice is powerful. Importantly, based on previous research bias in this field, listening to, understanding, and learning from the experiences of autistic women is critical for informing change at systematic, school, and classroom levels.

Methodology

A sociocultural approach (Vygotsky, 1978) underpins this study exploring girls, autistic identity, and education. We were interested in investigating how various sociocultural factors at school influenced the development of autistic identity for four women. This project involved three researchers who are not autistic (Suzanne, Beth, Keely) and four researchers who identify as autistic (Rachel, Jodie, Hannah, Bella). All four women had received late diagnoses of autism.

Drawing on a collaborative autoethnography approach (Chang et al., 2016) we worked together across four stages of research (Table 1).

Collaborative autoethnography is an iterative, qualitative research method in which researchers work together to collect autobiographical data and to analyze and interpret data collectively to gain a meaningful understanding of sociocultural phenomena (Chang et al., 2016). In this project, the four autistic women contributed to the development of guiding questions (see Appendix) for Stage 1 data collection. They then documented and shared their autobiographical data with the whole collective (authors of this article). The autobiographical data are descriptions about their experiences at school and personal reflections about how these experiences impacted their developing identity.

The research questions guiding the project were:

1. How do educational experiences in the school years nurture or erode identity?
2. How can collaborative autoethnographic reflections about educational experiences from four autistic women support our understanding of what is needed to improve support for autistic girls at school and nurture positive identity?

In the following sections, we describe our process for working collaboratively in the collective, and present the four autoethnographic *tales* which we agreed provided unique insights on the range of school experiences. We begin with Rachel who highlights the lack of teacher support and understanding about autism.

Table 1 Applying a collaborative autoethnography approach across four stages of research activities.

Stage	Research activity
1	Preliminary data collection: Individual self-writing and reflection and sharing in collective group
2	Subsequent data collection: Group sharing and discussion via online meetings and preliminary meaning-making
3	Data analysis and interpretation: Individual and collective analysis and interpretation
4	Collaborative group writing

Autoethnographic tales of school experience

Rachel's tale

In primary school, teachers didn't give me any extra support in learning from an academic viewpoint as it wasn't necessary. The tone taken by some of the teachers during the support could have been better, as I was sometimes treated as someone with a character flaw rather than a child having trouble with something. I don't think it was personally targeted at me, though: those teachers were like that with everyone. In secondary school, the only difference in learning support was that I was penalized for poor bookwork rather than offered support. My reaction to this was to feel annoyed that my grades could be brought down by an entire letter just because my books didn't look good enough for the teacher.

Rachel suggested that she received little support at school and comments about the annoying focus on bookwork influenced her belief that her work was not good enough. She continues to explain that although she was confident in her ability as a learner, she lost interest in doing well because the teachers did not align the teaching of the curriculum to her needs and interests.

Throughout all of school, I felt confident about myself as a learner and was aware of my strengths. Throughout high school, my average grades became worse than they were in primary school because that I could no longer be bothered putting any effort into subjects that didn't interest me. I suspect that the only way that teachers could have mitigated this would have been to show how their subjects could be relevant to things I was interested in. In terms of social support in primary school, my teachers didn't offer any support with making friends and I don't think it would even have occurred to them that was something they should do.

Rachel reflected on the importance of nurturing strengths and interests to support motivation for learning and success in school and how this could have further supported a positive sense of self and identity. She indicates that she received no teacher support in the social aspect of making friends which could have been important in promoting her sense of self and identity within the group context of school. These reflections also highlight how educators never consulted with Rachel about what she might need to help promote her success in the school environment and in turn positively influence her identity in that context.

Although I did have friends, I never had a sense of belonging. This is something that is innate to me rather than the fault of anyone or of any environment that I've been in. I don't do "sense of belonging". Even in groups where I'm a long-term and valued member, I don't have a sense of "us". It's always "me" and "all those other individuals". This doesn't mean, however, that I don't enjoy the company of others in my social group, or that I don't notice when I'm accepted and valued by a group. I'm quite happy doing my own thing. I don't see the point of trying to force a connection just for the sake of company, it seems like a lot of work for the "reward" of having to spend more time and effort forcing said connection. Similarly, my peers didn't particularly influence my sense of self and my sense of belonging at school as my sense of self isn't based on what other people are doing, and school was just somewhere that I had to go, so it didn't matter to me whether I belonged there or not. Ever since preschool, I've known that I was fundamentally different in some way from most other people, but I've also thought that this doesn't affect my worth as a person. I don't see myself as better or worse than anyone, just different.

Rachel reflects on how a sense of belonging and connection to the large group is not essential to supporting her identity about who she is and her sense of self.

Jodie's tale

Jodie's tale highlights the challenges she had at school. Similar to Rachel, Jodie was also achieving good academic results, but was finding it challenging to navigate "fitting in" with her peers and making friends. Her teachers also did not provide good support and had no understanding of the difficulties she was experiencing in the school context.

I remember being aware that I was different from my peers from a very early age but the idea that I was neurodivergent never occurred to anyone, especially not my teachers. In many ways, I excelled in school. I found reading and writing easy and was intensely interested in learning about the world. I never appeared to need support, but the reality was that every day was a struggle. I vividly remember sitting and watching the other children interact and trying to figure out what I needed to do to "fit in" and group activities filled me with dread. I was desperate to understand how the world worked, and why other people just seemed to "get it" and I became a voracious reader, trying to learn as much as I could in the hope it would help me understand the unwritten rules. This helped a little; however, I still found the social and non-academic aspects of school extremely difficult. In contrast, I was often praised for my academic performance, and I began to link academic success to self-worth and to see my social difficulties as a personal failing. Although I had a few friends, friendships were always difficult for me and I often preferred to play alone. The only advice that teachers offered was to tell me I needed to be "more flexible" and "just learn to get along". They obviously expected that I should know how to do this and that I was deliberately choosing not to be flexible and get along. However, with no guidance on what this meant, it led me to believe that I needed to hide my own feelings and needs and do whatever people wanted if I wanted to have friends and fit in. As I progressed through school and academic success became less socially desirable, I was labeled a "swot" and "teacher's pet" by my peers. This caused a great deal of distress and there was significant conflict between my desire to fit in with my peers – and potentially "fix" what I saw as a personal failing – and my desire to succeed academically, which underpinned my sense of self-worth.

As Jodie progressed through her schooling with little support, labeling and marginalization impacted her mental health and influenced her sense of identity within the school context.

The added pressures of high school also meant that my executive functioning and sensory processing differences became much more apparent and, although I still performed well academically, I struggled significantly just to get through the day. With no social

network to help support me, my mental health began to deteriorate rapidly, I began to self-harm, and I would often stay home “sick” as I become increasingly overwhelmed. Although I have some good memories of teachers who were engaging and whose classes I enjoyed, I received no support beyond general classroom instruction, and I felt largely invisible to both my peers and my teachers (several teachers who taught me throughout high school still did not know my name by the time I left). No teacher ever spoke to me about my wellbeing, despite becoming increasingly withdrawn and showing obvious signs of depression, and my absences were never raised as a concern because I continued to perform well academically.

Jodie, like Rachel, started believing in herself despite receiving little or no support from her teachers in ways that would support her connection and wellbeing in the school context and in developing a positive identity.

I made the deliberate decision to (essentially) not care whether people “liked” me or not and to stop trying to fit in. I realized that I had been masking my true personality because I thought it was the only way for people to like me, but I was still having the same social difficulties as before so what was the point? I also realized that I had been looking for friends in the wrong places, trying to fit in with groups that I thought I “should” be friends with, not people I connected with. My final two years of high school were a complete contrast. I (mostly) accepted myself and embraced the fact that I was different from my peers and found a very eclectic group of people who I connected with and who made me want to go to school each day – and it’s probably no coincidence that many of us have since discovered we are neurodivergent!

Hannah’s tale

Hannah’s tale also highlights her academic strengths, but illustrates the profound impacts teachers and their practices can have on a learner’s sense of self and identity.

When I started Prep, my teachers praised me for my ability to write in complete sentences while the other kids were scribbling. Despite attending a private school with resources, I was not offered any enriching opportunities to further nurture my abilities. So, as I progressed through junior school, while I continued to enjoy learning at home in my own ways, my achievements and growth at school never peaked in the way I think I could have if I had the opportunities.

In contrast, the following excerpt shows how positive teacher support can nurture positive identity, highlighting the powerful influence any single supportive teacher can have, or conversely be detrimental by not valuing or accepting a student’s interests and strengths.

[Teacher] made learning inspiring for me. On an individual level, he listened to whatever I had to say about my interests (sharks and politics), and on a curriculum level he allowed me to learn through my interests.

At the end of the year, before summer holidays, [Teacher] suggested I do something real-world with my interest in sharks. This encouragement led me to being able to do speeches for a local chapter of Sea Shepherd on shark conservation. However, when I returned to school for Grade 11, I was bullied because of my interest. It sounds harmless, but the way it completely isolated me from peers, and the way it made teachers treat me, really cemented how much I did not belong in the schooling system. [A different teacher] often talked about sharks in math class (in a mocking way) ... Once, he asked what my plans after graduation were. When I told him, he said in front of everyone, “Why can’t you just be normal?”. It was humiliating. In modern history, I never felt comfortable asking for help because the class dynamic was one big clique, and the teacher favored the bullies. [I felt] very let down by the system, like I was “too much” or “too weird”, and like I was expected to be someone I wasn’t if I wanted help. Those attitudes reinforced the behaviors of my bullies, teaching them: “it is okay to treat different people badly”.

Hannah describes how her negative school experience impacted on feelings of self-worth and identity, and acknowledges the positive impact of a good student–teacher relationship, which is critical to inclusive practice and a sense of belonging for all students.

The teachers who actively participated in and/or enabled my bullying, as well as the bullies and everyone who had been influenced by them (one of my best friends was too embarrassed to hang out with me anymore) affected my learning, my mental health, and my sense of self. I never felt the need to fit in – I didn’t want to change who I was, I didn’t think there was anything “wrong” with me and in fact I liked me very much, but I knew I was different and struggled to understand why. I felt very depressed and had suicidal ideations.

Bella’s tale

Bella’s school experience is more recent and highlights her awareness that she was different and how her teachers did not know how to support her learning and participation at school.

They supported me but they didn’t know what skills I needed from them to do my work. Just because I need help doesn’t mean I’m dumb, that I can’t do things. When a teacher said my work was nonsense that’s when I felt not very smart. It made me quite anxious, and it made me not very confident in myself. I think it’s hard for teachers to know how to help students to make friends. They don’t really know what kids need to make friends. Once I had friends, it was really hard to keep them because I didn’t have the skills and know how to keep them.

Table 2 Topics and themes.

<i>Topic</i>	<i>Theme</i>
1. School experiences	1.1 Positive and negative experiences at school 1.2 Did not receive support at school and teachers did not know how to help 1.3 Teachers had a negative view of difference
2. Identity	2.1 Relationships: Friendships, belonging, and others' perceptions 2.2 Masking/masquerading and being autistic 2.3 Diagnosis and being autistic 2.4 Impact on identity
3. Recommendations	3.1 Advice for teachers 3.2 Helpful support

Bella described how the social experience at school impacted negatively on her identity, and how the interactions with teachers and peers influenced her sense of self and belonging.

It sucked because I knew I could do it but I didn't know how to do it. It also sucked because I didn't have the confidence to ask the teacher for help so I would write on my paper "I need help", but that didn't help me. But when a teacher explained what I needed to do, I still didn't understand what I had to do which made me feel very confused and lost. The fact that I was so little – people didn't think that I could do things. That made me very upset and not very capable that I could do things. And defeated. It made me really upset to go to school. I never wanted to go to school. I pretended to be sick a lot and that's when my anxiety really developed, and I cried a lot. I was the outsider or the left over in the class. I was always left out and everyone was upset that they got me and not their friend. Everyone had friends and they were laughing and joking, and I was counting down the minutes to go home and be with my family where I felt safe. I really hated school. I didn't think I was very smart but I knew I was good at some things. Academic wise I found it pretty tricky back in the day. I did really try hard but people just thought I was being dumb. The worst thing a teacher can do is when they compare you to an age group and say, "they can do this, why can't you". Well, they can do this but I can't. It doesn't give you any confidence to do this, it doesn't help the kid.

Once the members of the collective had reviewed the four autoethnographic tales, we met together using an online meeting platform to discuss common themes that emerged across the individual tales. The group discussion was audio recorded and transcribed for analysis and interpretation. This was Stage 2 in the four-phase process (Table 1).

In Stage 3 we used a reflective method of analysis and interpretation (Braun and Clark, 2021), informed by the sociocultural approach (Vygotsky, 1978) and the literature that informed the study. The group interview transcript was read several times and data topics were identified. The themes were generated to describe patterns of meaning in the data that are united by ideas. Individuals and the collective provided comments and feedback which resulted in the final version (Table 2).

Analysis of topics and themes

Topic 1: school experiences

This topic reflects our discussion of school experiences that influenced identity in negative and positive ways.

Theme 1.1: positive and negative experiences at school

We all agreed the autoethnographic tales described negative experiences at school that resulted in disengagement or fear and negatively influenced the women's sense of self and identity. For example, Hannah said, "I've never failed a class or anything, so I know I'm very capable of all of that stuff, but I was just so uninspired, and not engaged, and I already didn't like the teachers. So even though I probably could have done the maths work, it was just 'I can't do it'". Comparatively, Jodie told us that she was

terrified of going into some classrooms: remember being forced to hold my pencil in a specific way when I was in probably Grade 2. You know, and that teacher, that's all I remember about her, is standing over me, like constantly forcing me to change the way I held my pencil. I was writing. I wrote legibly. But it just wasn't, you know, the standard pencil grip that you're supposed to use. And all I remember is her constantly telling me I was doing it wrong. And then they, and then I had her again, I think in Grade 5, because they switched the teachers around. And when I knew that I was having her, I was absolutely terrified of going in her class.

What is also apparent is the lasting effect that negative experiences had. For example, Hannah "already didn't like the teachers" and Jodie was still terrified of one of her early teachers three years later, reinforcing how one single negative experience can have a long-term influence on identity.

In contrast, Beth noted that some tales described the significant positive impact teachers supporting special interests could have, acknowledging when something was done well and making efforts to connect with students through these areas of interest. Jodie followed up by saying,

the teachers that were good, it's not that they necessarily did anything specific to support me, it's just that they, I felt like they liked me, I guess. You know, they were interested in me, and they were, yeah, I actually had some kind of relationship with them. And I think that was probably the major difference between feeling supported by them, even though they didn't necessarily give me anything specific, I just felt a lot more confident and comfortable, I guess, in their classes, than with other teachers.

It is clear from Jodie's comment that positive feedback and interest supported both a positive relationship and her confidence. She went on to say, "so when you kind of find people who can see other strengths, it really has a positive impact on your sense of self". Hannah also described some positive support from teachers. Even though the specifics of the support couldn't always be identified, these comments reflected that feeling accepted and valued had a lasting and positive impact.

Theme 1.2: teachers did not know what to do or how to help

We all agreed every tale showed a lack of support, or the right type of support, and limited evidence for student consultation to map out what support might look like: "whether we needed a lot of support in one area or not, like whatever our strengths were, we all didn't get the support that we needed to do better" (Hannah).

Rachel suggested, "I sort of noticed a pattern of teachers not really knowing what to do with us. Like, they knew something was different, if they noticed, but they didn't know what to do about it or how to support us". We all agreed with this statement.

Theme 1.3: teachers had a negative view of difference

The reflections often suggested teachers had negative views of difference that influenced the type of support that was provided, having a negative influence on students and their student-teacher relationships. For example, Hannah said, "even though we had different experiences, the teachers still responded to those things actually negatively". Jodie said, "I don't think that many teachers that are actually aware of how negative they are toward people in general". It is also important to note that none of the women reflected that they had at any time been consulted about what might help support them with their learning, interactions, and participation.

Topic 2: identity

Topic 2 has a number of themes highlighting how the development of identity is influenced by social interactions with others in the school community. These experiences are important to the development of identity, particularly in adolescence; however, whether those experiences are positive or negative is what may influence identity in destructive or helpful ways (Abbasi, 2016).

Theme 2.1 relationships: friendships, belonging, and others' perceptions of you

Rachel and Hannah agreed that they did not really care about not having many friends as reinforced by Rachel's statement, "I feel like I should set up an automatic Facebook message that says, 'Sorry I haven't replied to you in 6 months, we're still friends, the problem is entirely me'".

Realization and acceptance of themselves as "belonging differently" was echoed by both Rachel and Hannah and clearly time-stamped by Jodie:

I mentioned that, like, around Grade 9, I don't know, I had a bit of an epiphany, similar, and started to really not care too much, about people's perceptions of me, and not try to fit in. And I think that was, I don't think it's that we don't need to belong, necessarily, it's just a different type of belonging.

While "belonging differently" was acknowledged, Hannah observed that all tales still talked about not fitting in and that this was challenging and had an impact on identity, "*we all still knew that we couldn't fit in and we all still struggled in that way*". In contrast to this being a struggle at school, Jodie described how in adulthood she was now selective about fitting in, "*I don't want to try to fit in with people that I actually don't really like that much, I don't have much in common with*". The importance of acknowledging, understanding, and respecting a sense of connectedness and belonging differently for this cohort of learners is important for schools to understand so they can support the development of identity in positive ways. Further to belonging differently was the realization the women made during their schooling that what others thought of them was not important.

Theme 2.2: masking/masquerading

Similar to other experiences reported in research (Bargiela et al., 2016; Cage and Troxell-Whitman, 2019; Hull et al., 2017; Milner et al., 2019), Jodie and Bella shared examples of how they masked/masqueraded within the social context of school to fit in with peers and belonging. Jodie said:

That was kind of like my whole school experience, until yeah, probably Grade 9 ... it was just so stressful, trying to dig up this internal conflict going on all the time, over yeah, I just want to kind of be myself ... As in, you don't want to fit in to that kind of situation, or that kind of group, necessarily, but you want to find somewhere where you do fit in, I guess. And so you're just sort of masking to try and find somewhere where you fit in ... over the years I've realized that masking in the long-term, like, isn't beneficial. But it's so ingrained, it's really quite difficult not to do, I guess, especially when you meet new people. Yeah, really not good for my mental health, I know that for sure.

Bella described the challenges she experienced with fitting in and the negative impact this had:

because I struggled so much to like feel like included in things, I would just sit with anyone, not anyone, but like, people didn't actually know the real me, I think, they didn't know the real me, because I would pretend to be someone I was not.

In contrast, Rachel said:

I think my experience of masking is kind of different from a lot of the accounts of autistic people that I've heard. Because I've heard of masking as a lot of suppressing of traits, like "Don't stim, don't talk too much about your interests", but if I'm just left to my own devices, I will, I won't talk someone's ear off, I will just go away and ignore everyone and read about stuff that I find interesting. So for me, it's been more about constructing a social persona for people to interact with, and actually remembering to talk to people, and show interest in people, and things like that.

Aligned with previous research findings, these experiences reinforce masking is only a short-term, superficial way of coping, masking feelings of unhappiness, anxiety, and loneliness (Cage and Troxell-Whitman, 2019; Hull et al., 2021; Schneid and Raz, 2020). Intersections of autism and gender are evident in the tension between conforming to the school girl culture displayed by masking/camouflaging and accepting their differences.

Theme 2.3: diagnosis and being autistic

All the women reported how they knew they were different at school, but did not have a diagnosis at the time. Bella suggested, "I think if I was diagnosed with autism when I was younger, I think it would have just made my schooling a whole lot worse for me. Cause I would have had the label of autism". Jodie said, "I'd never even heard of autism when I was a kid. I didn't know anyone who was diagnosed. I'm sure they were, but you know, it wasn't spoken about or anything. So yeah, I think you're probably right. And yeah, maybe going forward, hopefully it'll make a difference". Hannah commented, "If I had the diagnosis, it would have just given the teachers more to pick on me for".

We all acknowledged that some of the tales described the autistic traits which the women gradually accepted as important to their own identities. They described their special interests and changing obsessions, how they enjoyed being with friends and siblings who also received a late diagnosis of autism, the challenge of keeping up appearances of friendships, and meeting various social expectations. These intersectional experiences of autism and gender had a strong impact on identity.

Theme 2.4: impact on identity

Rachel and Hannah shared stories about how their experiences impacted their own identity. Rachel said:

in addition to the fact that I had enough positive feedback coming in, like I was always into music, and even teachers whose classes I was failing knew that and respected me for it, was that I've always had a very clear sense of who I am, and what I want, and where I want to go. And other people's opinions on that have always been kind of irrelevant to me.

In contrast, other experiences within this theme highlighted occasions when teachers' actions or speech explicitly impacted students as being different or not belonging.

Topic 3: recommendations

As a collective, we didn't talk in depth about ideas that would help teachers in the future. As a result, the data reported below is taken directly from the autoethnographic tales and addressed the following questions:

- Considering your own experience, what advice do you have for future school teachers who have girls on the spectrum in their classroom?
- What characteristics of routine teacher interactions cumulatively impact on student identity over the primary and secondary years; consider positive and negative interactions. What did teachers say and do that helped you to see yourselves as capable versus incapable?

Theme 3.1: advice for teachers

Rachel

The advice I would give future teachers who have girls on the spectrum in their classroom is to teach them to be assertive. Teach them that they are just as good as anyone else, and that they deserve a place in the world just as much as anyone else. Teach them that they don't need to be agreeable and acquiescent. And make sure you show this through your actions, because words are cheap, but if you're telling a person they're great and valuable while acting dismissive toward them, ignoring bullying, and constantly acting as though their neurotypical peers are right and they're wrong, they will notice, and they will internalize it.

Hannah

Advice for teachers with autistic girls in their class: do not expect "different" students to be more like neurotypical kids. Invest time into developing a good relationship, and then use your position to empower them to embrace their identities, their unique strengths, and their interests. Also, don't ignorantly uphold the traditional and pathologizing ideas of autism: learn about autism through the neurodiversity model.

Jodie

My main advice for teachers would be to get to know your students as much as possible, make sure you are aware of the less well-known indicators of autism and neurodivergence, seek information about autism from autistic students and/or adults, and remember that it is vital that you consult with the student about their needs. If my teachers had known me better, I may have received my diagnosis much earlier in life (I was diagnosed at age 36, following my daughter's diagnosis) and this could have made a huge difference, not just at school but in all aspects of my life. Routine teacher interactions can have a huge impact on identity, and even positive ones can have a negative impact. Language and framing can make a big difference. The combined effect of being praised for academic success rather than effort and the expectation that social interaction should be effortless led me to believe that self-worth was intrinsically linked to success and/or failure and that the amount of effort was meaningless.

Bella

Find out what people are into and use that to get them to tick. I know that you have to have a lesson plan but some kids, if it's a PowerPoint presentation we don't know what to do with that. Be flexible, go with the flow and have little bits so that if a teacher (this is hard trying to find out what to say, I sometimes I find it hard to put things into my own words) ... Everyone has a battery so if their battery is full, don't expect them to be able to go home and write up an essay. It takes me 3 h after school to decompose everything that has happened in the day. If you push it we won't do so great the next day at school.

Theme 3.2: helpful support

Rachel said:

The thing that teachers did in the course of the everyday that helped me to see myself as capable was to treat me as capable and to have high standards for me. Even when I had trouble with something, their attitude was "you need to practise this more", not "you can't do this".

Discussion

In this section we have taken a collective approach to interpreting the data, drawing on a collaborative autoethnographic approach. The opportunity for collaboration within the collective promoted self-reflexivity associated with autoethnography, intersectionality, cultural learning and interpretation, and multi-subjectivity associated with collaboration (Chang et al., 2016). We worked together across the four stages of research (Table 1) to address the research questions for the project:

1. How do educational experiences in the school years nurture or erode identity?

The women's tales describe negative experiences at school and illustrate how the social and cultural interactions had a lasting negative effect on their self-identity. It seems that teachers' interactions were influenced by deficit-based views about difference and that many teachers did not take the time to understand their students and seek ways of supporting them to be successful in academic and social ways. It is evident that these negative experiences marginalized the girls (Urbanawicz et al., 2019) and

emphasized their differences. These tales help educators understand how identity development is intersectional (Crenshaw, 1991) and influenced by interactions with others, social belonging, group membership, achievements, and teacher feedback. The women described their social creativity and strategies to socially connect with their peers. It was evident that they used their own strategies to manage stigma, enhance their own self-esteem by creating counter-narratives, and revalue stigmatized traits (Dirth and Branscombe, 2018). Over time, the girls gained a better understanding of themselves which was important to their wellbeing (Cooper et al., 2020). Individual agency influenced the development of positive identity development (Erentaitė et al., 2018).

Some teachers' words and behaviors, sometimes single events, caused significant stress and anxiety. Mental health difficulties were evident in most accounts, consistent with research suggesting that almost three-quarters of autistic adolescents meet criteria for mental health concerns (Hull et al., 2021). Autistic women have particularly high mental health needs combined with unmet needs for support in education and social difficulties (Baldwin and Costly, 2016). This can be attributed to the experience of dealing with stigma and discrimination as well as to the masking of autistic traits to appear normal, particularly for young women at school. These autoethnographic reflections support previous research on masking and mental health in autism (Hull et al., 2021; Schneid and Raz, 2020).

The women also reported how teachers could make a positive impact by showing interest, care, understanding, and support. Relationships with teachers and peers influenced identity across the stages of school, showing that identities are fluid and contextual (Leary and Tangney, 2012). The tales illustrated that masking/masquerading possibly supported a fake sense of belonging, before the realization that it was acceptable to "belong differently". All of the women reported how they knew they were different at school but did not have a diagnosis at the time and acknowledged that this contributed in various ways to their developing identity in the school years. Teachers have an important role to influence individual identity development in positive ways, be sensitive to intersectionality, and also to facilitate positive interactions in social groups at school because the dynamics, talk, and activities in the groups influence identity development and motivate actions and future opportunities. Belonging or "belonging differently" provide positive connections and support relationships and motivation to be successful at school.

We put forth four propositions to address Research Question 2, illustrating how educational experiences in the school years nurture or erode identity.

2. How can collaborative autoethnographic reflections about educational experiences from four autistic women support our understanding of what is needed to improve support for autistic girls at school and nurture positive self-identity?

Proposition 1. It is important to view autism through a neurodiverse lens and embrace/accommodate individual differences instead of employing a medical lens that focuses on efforts to "fix" or "fit in" to the perceived norm or assuming incompetence against standardized perceptions of what is acceptable.

Regardless of whether girls have a diagnosis of autism, teachers play a key role in being sensitive to intersectionality in identity, and modeling acceptance of student diversity. This requires acknowledgment, without judgment, that everyone has strengths and areas that challenge them. "Without judgment" implies genuine acceptance of difference and may necessitate teachers to confront not only the inequities present within their school setting but those within their own personal values. These ethnographic tales clearly describe, at times shockingly, why teachers must check not only what they say, but the nuance of how they say it and to whom they say it. While looking over this manuscript, Rachel suggested that teachers ask themselves, "Is this student's difference hurting anyone?" If it isn't, don't try to change it".

Proposition 2. Getting to know and consulting with students will facilitate personalized support.

Teachers who know and value their students are in a unique position to encourage positive relationships and connection with the curriculum. The key could be to build structures within schools that provide diverse students with opportunities for membership to a group. While stigma, discrimination, and masking are associated with poor mental health for autistic individuals (Botha and Frost, 2020), a sense of belonging and acceptance by peers can support the development of positive identity because identities are formed and maintained by reflecting on the world and our place in it (Chaffee, 2020). Listening to students in student-teacher consultations will inform the implementation of tailored and personalized supports. This approach would nurture educators' understanding of how to support autistic girls to identify and understand their own personal needs.

Proposition 3. Taking a strengths-based approach by promoting autistic students' strengths and interests.

The ethnographic tales highlighted the power of teachers' responses to the girls' strengths and interests. Celebrating and encouraging "passions" as opposed to lamenting or ridiculing "obsessions" leads to very different outcomes. Accepting and encouraging learning through interests can promote continual learning achievement for autistic girls. Furthermore, autistic individuals view special interests as an attribute of their autistic identity (Cooper et al., 2020). Failing to acknowledge, or at the very worst ridiculing, the intense or special interests of an autistic student is detrimental to their identity formation.

Proposition 4. Teaching autistic students to be proud of who they are and to be assertive to find their place in the world.

As discussed in the Introduction, awareness of how autistic girls present is recent, in part because they effectively "mask" their authentic selves in their efforts to fit into existing group structures. In fact, girls are more committed to their identity earlier in their adolescence than their male counterparts (Klimstra et al., 2010). One consequence of this is that girls are more strongly wedded to their group status and existing social connections (Geary et al., 2003) than boys (Klimstra et al., 2010). Girls who are members of an "in" group are more likely to stigmatize and discriminate toward girls who are not within their group (Ehala, 2018). For autistic girls who are trying to fit in, the challenge they face is therefore enormous. In their reflections and throughout the discussion, the autistic women spoke of the downsides of masking, such as suppressing one's own feelings and needs, negative impacts on mental health, not making true connections with people, increased feelings of isolation, and the fact that masking is difficult and tiring. It is clear that teachers have an important role in supporting students to be proud of their autistic identity.

Conclusion

Previous research has demonstrated that school experiences vary greatly depending on teachers' knowledge of and attitudes toward difference/autism (Liasidou and Ioannidou, 2021). The experiences of autistic females are under-researched in comparison to their male counterparts. Accounts of female experiences are therefore important to help counterbalance the historic dominant male bias in research (Milner et al., 2019). The opportunity for collaboration within the collective of women drawing on an autoethnographic approach enabled us to reflect and interpret in social and cultural ways, highlighting multi-subjectivity associated with collaboration (Chang et al., 2016). According to Chang (2013), successful social interaction requires an understanding of both self and others. Collaborative online meetings encouraged active agency in the process of explaining and justifying directions and research objectives; they also helped to build trust between the co-authors and supported effective teamwork, communication, and positive relationships in ways that made the process both productive and enjoyable. The data and individual and collective interpretations can inform not only increased awareness and understanding of autistic females, but help educators develop more inclusive ways to support this group of learners in school contexts that promote a positive sense of identity. It is important therefore that practices that support inclusion, minimize marginalization, acknowledge intersectionality, and support a positive sense of identity are nurtured for autistic learners and autistic girls specifically.

Appendix

Final guiding questions for Stage 1:

- Did teachers support you or not support you in learning? If so, how?
 - How did you feel about support or lack of support? What impact did this have on you?
 - How did you feel about yourself as a learner?
- How did teachers support you to develop friends?
 - Describe how your experiences influenced your sense of self and your sense of belonging in the social group.
 - What else helped or would have helped you to make friends?
- How did your peers support you or not support you in learning?
 - How did your relationships with peers influence how you thought about yourself as a learner?
 - How did your peers support your own sense of yourself and your sense of belonging at school?
- What else influenced your sense of self?

From Dunn to Morgan and colleagues: a brief history of disproportionality	498
Responses to Morgan and colleagues	500
Overrepresentation and the social and intersectional disablism model of dis/Ability	501
Conclusion	504
References	504

As we move into the third decade of the 21st century, it seems increasingly hard for the thoughtfully observant among us to sustain a healthy optimism in humanity's capacity for resolving its most agonizing injustices. We write this chapter in the aftermath of George Floyd's murder under the knee of a malevolently racist police officer and the police shooting death of Breonna Taylor as she slept in her bed. We trust the reader will not only forgive but embrace this somber opening because we wish to make the case that the politics of what happened to these two Americans (among so many others) is intimately tied to the politics of schooling at the intersections of race and dis/Ability¹—most specifically to the construction of the educational debt (Ladson-Billings, 2006) and the pathologization and overrepresentation of Black, Indigenous and People of Color (BIPOC) students in special education programs, leading in turn to the ongoing educational segregation/exclusion and coinciding with hyper-disciplining of these students that is now recognized as integral to the school-to-prison pipeline (Annamma, 2015; Blake et al., 2011; Kim et al., 2010; Skiba et al., 2002; USDOE, 2016).

However, what happened to George Floyd and Breonna Taylor is not only a species of hegemony within the United States, but a stark reminder that the evil of racism is alive and well internationally, since the root concept of race began during the "Enlightenment" period in Europe (Suárez-Krabbe, 2014). Throughout the Global North, scholarly analyses of the intersection of race and dis/Ability have illuminated the issue of disproportionality and expanded it to include other groups such as migrant and immigrant students (Artiles et al., 2011a; Erevelles, 2011; Migliarini, 2017). These analyses also reveal the manner in which the illusive concept of "inclusion" within the US and internationally has been co-opted to truly mean inclusion into hegemony (Artiles et al., 2011b). McDermott et al. (2011) have aptly identified this co-optation as "global norming," which has served to perpetuate stratification, labeling and management of "deviant" bodyminds into predefined hegemonic ideologies of normal. Accordingly, these ideologies conceal dominant discourses within 21st century institutions that began during colonization of the Global South by the Global North as part of the sociopolitical state apparatus (Althusser, 2014). Recently, the field of Disability Studies in Education (DSE), and in particular Disability Studies and Critical Race Studies (Annamma et al., 2013), has taken a turn toward global conversations (Connor et al., 2021). For example, Connor et al. (2021) posed the following question:

... how can we jointly create more shared and dialogic spaces between the Global North and South, concepts that by their very existence reify hierarchies? And how can DisCrit can be placed in service of addressing existing inequities without enacting an imperialist gaze? (p. 604).

In turn, this question raises another—what is happening within the US surrounding not only the disproportionality issue but also extending to the very humanity of young Black, Indigenous and People of Color with and without dis/Abilities, both inside and outside of educational contexts and within the global cultural-historical context (Artiles, 2009, 2019; Iqtadar et al., 2021).

It is with this global cultural-historical context that we write from our positionality and relationalities (Evans-Winters and Espósito, 2019). The first author identifies as a cisgender white female. The second author identifies as a Dis/Abled Latinx of El Salvadorean and Palestinian heritage gay cisgender male who was labeled with an Auditory Learning Disability and experienced special education programming and trauma (Hernández-Saca, 2021). The third author identifies as a Black queer cisgender female.

The purpose of this chapter is to demonstrate, through our critical analysis of the debate surrounding the overrepresentation of BIPOC students in special education, that researching dis/Ability at the nexus of race and other markers of difference is inevitably a moral, spiritual and therefore political act (Hernández-Saca and Cannon, 2019; Williams, 1987). Accordingly, we assert that the most important and meaningful questions pertaining to dis/Ability and education can never be resolved by invoking

¹By dis-dash-Ability (dis/Ability), we mean to underscore the political and sociocultural construction of both disability and ability at the intersections of power and identities. We capitalize the "A," in dis/Ability to resist the deficit thinking and language (Patton Davis and Museus, 2019) associated from the medical-psychological model of disability in history and society associated with people with disabilities at their intersections of power and identities.

methodological neutrality to settle what are essentially moral, spiritual and political problems. In the process, we make the case that Paul Morgan et al.'s. (2015) research announcing that overrepresentation is “not” a problem—and that BIPOC students are not in fact overrepresented but instead underrepresented in special education programs—is not new, but is instead an elaborated iteration of timeworn, eugenically tinged methodological commitments (see: Stubblefield, 2007).

In what follows, we first provide a brief history of the debate surrounding overrepresentation. This historical overview includes Morgan et al. (2015) research asserting that the problem of overrepresentation is more imagined than real. Next, we outline the outpouring of scholarly responses to their work. We then extend and elaborate on these responses to make the case that until *we stop looking for something outside of ourselves* through the use of objectivist research methods to adjudicate knowledge claims about how we should and should not educate children, we will inevitably adhere to policies and arrangements that impose racist-ableist-sexist-capitalist competition on schoolchildren. More to the point, it is not only possible but essential that educators deliberately engage in a moral and spiritual re-imagining of what we want education to be for and about. In the absence of such a re-imagining, we will continue to have the same unresolved debates, spinning in the same amnesic circles one generation after another. Finally, we contend that this position has distinctly praxical implications pertinent not only to the overrepresentation problem, but also to the goal of improving the educational experience and promise for ALL students, but specifically BIPOC students with and without dis/Abilities.

From Dunn to Morgan and colleagues: a brief history of disproportionality

Even before special education programs were federally mandated in American public schools, Lloyd Dunn, a prominent scholar in the field who was nearing retirement, surveyed the evolving landscape and noted with deep apprehension that special education classrooms contained proportionally more Black, Indigenous and People of Color (BIPOC) students than general education classrooms—quite noticeably more, in fact. His 1968 “swan song” article published in the journal, *Exceptional Children*, posed a seemingly straightforward question—is the expansion of these classrooms educationally justifiable? His own answer was an emphatic, “No!” Not only did Dunn see them as stigmatizing, segregating and restricting BIPOC students, he also asserted that in his view:

... much of our past and present practices are morally, and educationally wrong. We have been living at the mercy of general educators who have referred their problem children to us. And we have been generally ill prepared and ineffective in educating these children. *Let us stop being pressured into continuing and expanding a special education program that we know now to be undesirable for many of the children we are dedicated to serve* (p. 5, emphasis added).

Dunn's critique was followed by Deno's (1970) prescient essay warning that the burgeoning field of special education's bent toward establishing and expanding dis/Ability identification categories would result in more harm than good for students. Deno (1970) stated: “... the medical model criteria on which these classifications are based ... too often have limited or undetermined relevance to the educational decisions that need to be made” (p. 332). Deno (1970) went on to explain that, “... the emphasis on ‘defect’ residing in the child tends to focus attention away from the external variables which educators might be in a position to do something about” (p. 232). The emphasis, Deno believed, should be on remediating the general education classroom and schools rather than pathologizing and segregating students—particularly those marginalized at the nexus of racism and poverty. The field of special education, Deno also believed, should be intent on “... work[ing] itself out of business as a social institution” (p. 333). In the best of all worlds, by sharing its instructional breakthroughs with general education, special education as a separate system would essentially make itself redundant. Three years later, Mercer (1973) directly confronted the overrepresentation of BIPOC students in special education, finding that Hispanic and Black students were significantly overrepresented in the derogatory special education category of what was then called, “Mild Mental Retardation (MMR),” today called Intellectual Disabilities (ID).

After the Education for All Handicapped Children (Public Law 94–142) was signed into federal law, dis/Ability categories expanded apace. And, as Artiles and Trent (1994) noted, the expansion of dis/Ability categories over the 1980s extended overrepresentation into the newer ones such as Specific Learning Disabilities (SLD) (See: Ong-Dean, 2006). It is more than passingly interesting, though, that this particular category initially overrepresented white students because it originated as a safe harbor for struggling middle class white students from the stigma of the “MMR” programs already disproportionately representing BIPOC students (Sleeter, 1986). That situation shifted precipitously in the aftermath of class action lawsuits ruling in favor of the plaintiffs' arguments that IQ test bias resulted in the overrepresentation of BIPOC students in MMR programs (see: Larry P. v. Riles, 1972, 1974, 1979, 1984, 1986). Consequently, as fewer BIPOC students were identified as “MMR,” the SLD category became the new default placement for “under-achieving” students. Because the SLD category was primarily created to preserve white privilege and educational advantage for affluent whites, the growing placement of BIPOC students into the category was soon seen by whites as tarnishing the redemptive *mystique* of white SLD students fetishized as intellectually “exotic” rather than “disabled” in the *usual* sense of the word (Carrier, 1986; Sleeter, 1986).

In short, many if not most of the contemporary critiques of special education had been articulated by pioneers in the field even before special education had become the law of the land. These critics were acutely aware of the stigma of dis/Ability labels. They knew that dis/Ability labels were conceptually and practically flawed—in addition to being less than useless in informing instructional and placement decisions. It was clear to them that something was very wrong with the disproportionate number of BIPOC

students in classrooms for students identified by these stigmatizing labels. Early on, it was also increasingly evident that segregated special education placements were not superior to general education placements. Quite the contrary, in fact.

As it turned out, of course, these warnings and critiques went largely unheeded as other scholars and researchers pushed back against these incipient threats to the status of the field. Reschly (1984), for one, expressed incredulity and dismay toward what he considered “sweeping allegations” of institutional racism and test bias raised by those who pointed to overrepresentation as a problem. Troubled by what he viewed as a precipitous rush to misjudgment, Reschly applauded the *National Academy of Sciences* report (Heller et al., 1982) for asking what he considered to be the important question—“Why is disproportion a problem?” (p. 15). From Reschly’s perspective, the crucial issue had to do with the lack of specificity in the dis/Ability classification system. State variations in terminology and criteria resulted in changes in students’ classifications merely by crossing state boundaries. Yet, doubling down on attempts to refine classification procedures and criteria held little promise for resolving the problem of overrepresentation. Reschly instead favored the idea of generic renaming and combining of dis/Ability categories, an ingenious move that would doubtless do more to elide the issue than confront it head on.

As overrepresentation gained increasing attention among scholars and the public, defenders became more concerted in their efforts to minimize its challenge to special education’s standing. MacMillan and Reschly’s (1998) attempt at this goal proposed that a more *cautious* way to view and understand overrepresentation was to calculate, out of the entire population of BIPOC students, what percentage were identified as having a particular dis/Ability. This alternative statistical rendition attempted to swap the most common understanding that considers overrepresentation as the proportionally larger special education enrollment of a historically multiply marginalized group as compared to their proportion of the school population (see: *Office of Civil Rights*). For the sake of illustration, Mercer (1973) found that while Hispanic students ages 6–15 constituted 7% of the Riverside, California school population, these students comprised 12% of the students in special education programs for students who were, at the time, labeled as having “MMR” or “educable mentally retarded” (“EMR”). More strikingly, this study also established that while African American students made up 9.5% of the population, they represented a whopping 32% of the students in these programs. In short, the calculation compared the percentages of students from historically multiply marginalized groups in the general school population to their percentage representations in various special education programs.

With MacMillan and Reschly’s (1998) replacement of one algorithm with another, the *Office of Civil Rights*’ troubling statistic revealing 34.64% of the MMR category to consist of Black students (% category by group) became the more palliating statistic of 2.10% of all Black students in the “MMR” category (% of group in category) (MacMillan and Reschly, 1998, p. 18). *Put in plainer terms, they proposed that we should not view overrepresentation as Black students embodying one out of every three students in the “MMR” classroom/program. Rather, they wanted readers to think of overrepresentation as asking what percentage of all Black students are labeled as “having” “MMR.”* The answer is only a tiny bit over 2%—a seemingly much more assuasive number. Or is it? For white students, the percentage of the group in the “MMR” category was 0.81. *This still means that roughly two and a half times more Black students were labeled “MMR” compared to white students.* In actual numbers, out of a hundred thousand students, over 2000 Black students would be labeled as “MMR,” but only about 800 white students. This disproportionate representation is hardly the tempest in a teapot these researchers wanted to portray it as being.

MacMillan and Reschly (1998) also argued that overrepresentation statistics were confounded first by the difficulties of defining race (or what they called “ethnicity”) as a quantifiable variable and second by their assertion that “ethnicity” is actually a proxy for socioeconomic status (SES). “When ethnicity is the only independent variable,” they quipped, “interpretations tend to emphasize ‘the figment of the pigment’” (p. 20). In our upcoming discussion of Morgan et al.’s. (2015) study, we will revisit this disingenuous attempt to invoke the cultural construction of racial categories and the intersectionality of race and class as vehicles for effacing the overrepresentation of BIPOC students in special education. Still, at this point in time, these arguments did little to appease mounting censure surrounding the status quo.

At the dawn of the 21st century, a study by Harvard’s Civil Rights Project (Losen and Orfield, 2002) again substantiated the fact that a disproportionately high number of BIPOC students were placed in special education. In their study, African American children were almost three times (2.88) as likely as white children to be identified as having an “intellectual disability,” 1.9 times as likely to be identified as “emotionally disturbed,” and nearly 1.3 times as likely to be identified as having a “Specific Learning Disability” (SLD). Native American children were 1.3 times as likely as white children to be identified as having an “intellectual disability,” 1.24 times as likely to be identified as “emotionally disturbed,” and 1.50 times as likely to be identified as having a learning disability. Latino children are 1.17 times as likely to be identified as having a “SLD.” Not surprisingly, BIPOC students are significantly more likely than white students to be placed in unequal and segregated special education classes for more of the school day. The extent of this phenomenon led researchers to conclude that these dis/Ability identification and placement patterns have systematically expedited the racial re-segregation of American schools (Artiles and Trent, 1994; Blanchett, 2009; Ferri and Connor, 2005; Fierros and Conroy, 2002; Losen and Orfield, 2002). Now, as we enter the third decade of the 21st century, well over four decades of research, scholarship and public policy has attempted in vain to address the problem (see: Artiles, 2019; Artiles et al., 2010; Cooc and Kiru, 2018; Cruz and Rodl, 2018; Skiba et al., 2016b). More recently we have been presented by Morgan et al.’s. (2015) research asserting that it is a *nonexistent problem after all*.

Morgan et al.’s. (2015) study made a smashing debut. Not only did it receive an advance press release before it was presented at the American Educational Research Association (AERA) conference, but it also attracted attention from the popular press—a relatively rare event for educational research (Morgan and Farkas, 2015; Phippen, 2015). And no wonder. Research announcing to the public that its educational system was not as “racist” as it might have been feared was good news, indeed. What a great relief this proclamation was for so many white Americans—“racism without racists” (Zuberi and Bonilla-Silva, 2008).

In their op-ed in the *New York Times*, Morgan and Farkas explained that, “The real problem is that black children are underrepresented in special education classes when compared with white children with *similar* levels of academic achievement, behavior and family economic resources” (Morgan and Farkas, 2015, emphasis added, n.p.). What they sought to do in their research, in other words, was to demonstrate that overrepresentation of BIPOC students in special education was caused by more dire “background conditions” affecting these students, not discrimination. When they applied statistical controls for said conditions, it appeared that these students were less likely rather than more likely to be placed in special education programs (See Gordon, 2017, 2018). Assuming the mantle of seemingly “liberal champions” of dis/abled BIPOC students, they asserted that the previous decades of research that informed policies to prevent overrepresentation were egregiously misinformed and therefore discriminatory in that they denied needed resources and services on the basis of race, ethnicity, and language. For most of the public and many professionals, this was compelling news that seemed to render five decades of critique entirely misguided.

Responses to Morgan and colleagues

It is something of an understatement to say that many scholars with longstanding engagement with this issue, and those with a very different set of ideas about the politics of research on dis/Ability, were distinctly unimpressed with Morgan et al.’s (2015) work. Their scholarly responses ranged from critiques on the technical merits of their research to commentaries on their conceptual flaws.

Skiba et al. (2016a) critique essentially centered on what they viewed as substantial shortcomings of a technical nature in Morgan et al.’s study. The upshot of their criticisms highlighted Morgan and his colleagues’ audacious declaration that not only was decades of research about overrepresentation wrong but entirely backward. Among other concerns, Skiba et al. (2016a) noted:

- Their limited database consisting of unverified self-reported teacher estimates that, had the authors been so inclined, could have been validated against a rigorous federal data base.
- The fact that studies conducted by prominent agencies (e.g., U.S. Department of Education and the National Research Council) using federal data sets during the same period from which Morgan et al. drew their data, “... found significant overrepresentation of African American students in the disability categories of ID [intellectual disabilities], ED [emotional disabilities], and LD [learning disabilities].”
- The researchers’ confounding combination of racial categories (Native Americans, Asian Americans, and Pacific Islanders), despite significant cultural differences, making it impossible to demonstrate what national studies had previously found to be the case—the significant overrepresentation of Native Americans in special education.
- Their “simplistic” claim that overrepresentation is primarily if not entirely a function of SES despite extensive literature demonstrating the very culturally loaded judgments about criteria (social-behavioral and adaptive behavior) that form part or most of the bases for the dis/Ability categories of ED and ID. Additionally, they cited research studies that, “... African American students were most overrepresented in the category of ED in *high SES* districts” (p. 222, emphasis in original).
- Their use of indirect methods of counting special education enrollment that has been shown by previous research to, “... find that the introduction of SES as an independent variable reduces findings of overrepresentation to non-significance (or have failed to find overrepresentation entirely,” while studies relying on direct counts found that race was the significant variable regardless of SES (p. 223).

Crucially, Skiba et al. (2016a) also demonstrated that Morgan et al.’s conclusions both *misrepresented and even contradicted their own data*. This surreptitiousness is something that we (the present authors) found to be present in earlier statistical attempts seeking to minimize or erase the overrepresentation of BIPOC students in special education (see: Hosp and Reschly, 2004).

As an interesting aside, Hosp and Reschly (2004) made the case that *academic achievement* is a variable subject to more control by special educators and should be researched rather than economic and demographic variables over which educators have no control. Oddly, these researchers contradicted their central premise at the conclusion of their article by confessing that their data did not after all support their hypothesis that academic achievement accounts for overrepresentation. They also went a step further, adding that it is in any event impossible to pin down and statistically disentangle the relevant variables that might account for this phenomenon. One might expect that this sagacious admission would have finished off future efforts in this direction, but that has clearly not been the case. Like those preceding it, Morgan et al.’s statistical analysis thus brings to mind Andrew Lang’s familiar observation that, “Most people use statistics like a drunk man uses a lamppost; more for support than illumination” (n.d, n.p.).

Conceptual critiques centered on a whole range of erroneous assumptions in Morgan et al.’s study (see: Collins et al., 2016). First, Morgan and his colleagues assumed that receiving special education services is indisputably advantageous. Citing the most authoritative research on long-term outcomes for students exiting special education programs (Newman et al., 2009), Collins et al. (2016) refuted this assumption, stating that these students, “... continue to experience lower graduation rates, poorer post-secondary outcomes, and higher rates of unemployment and underemployment ...” (p. 5). They also pointed out that three-quarters of students labeled as having emotional/behavioral disorders end up entangled in the criminal justice system at some point in their lives—a finding that has highly meaningful implications for overrepresented BIPOC students given the enormous disproportionality in the US prison system of mass incarceration (see: NAACP). Disturbingly, Losen and Gillespie (2012) reported that, “... one out of every four (25%) Black children with disabilities enrolled in grades K-12 was suspended at least once in 2009–2010,” and that, “[s]tudents with disabilities and Black students were also more likely to be suspended repeatedly in a given year than to be suspended just once. The reverse was true for students without disabilities and for most other racial/ethnic groups” (see also: Rausch

and Skiba, 2006). Further, BIPOC students in special education are excluded from the general education classroom in significantly larger proportions (Bal et al., 2019; Fierros and Conroy, 2002; Losen, 2015; Skiba et al., 2016b).

Second, Collins et al. (2016) contested Morgan and his colleagues's *within the person* account of dis/Ability—otherwise known as the deficit view of dis/Ability. By locating, "... the issue of overrepresentation either within the bodies, behaviors, or brains of students, they failed to unpack why it is that only the most subjective disability categories are more likely to be attributed to [BIPOC students]" (p. 6). Accordingly, their objectivist medical modelist view of dis/Ability absolves them from moral and spiritual introspection about the role of racist stereotypes, policies and practices in dis/Ability identification (see: Baynton, 2001; Kliever et al., 2015). This deficit view further occludes responsibility for enacting this privilege.

Third, Morgan et al. (2015) assumed that resolving disproportionality is a simple matter of accurate dis/Ability identification—an assumption that is itself premised on their objectivist epistemological stance. It is telling that they did not concern themselves with the politics of defending this position—even when they acknowledged the "judgmental" disability categories as the ones in which overrepresentation has become a problem. The point here is that their medical modelist view of dis/Ability and its epistemological underpinnings lead them to overlook the implications of their own (apparently murky) recognition that disability is a social/cultural construct and one that, in a racist culture, is thoroughly and unavoidably imbued with racist stereotypes. Given their own admission of the judgmental nature of the disability categories, their baseless stance that "accurate" disability identification is possible provides an incoherent footing for their assertion that increased identification of BIPOC students makes sense as an equity measure and remedy: *nothing could be further from the truth*.

From the outset, we contended that researching dis/Ability is inevitably a moral, spiritual and therefore political act. It cannot be otherwise because dis/Ability at the intersections of power and identities is a moral, spiritual and political construct (See: Hernández-Saca and Cannon, 2019). We also asserted that important and meaningful questions pertaining to dis/Ability and education cannot be resolved by invoking methodological neutrality to settle what are essentially moral, spiritual and political problems. By extension, methodological neutrality cannot resolve the problem of overrepresentation because it created the problem in first place. In what follows, we demonstrate how the epistemological and ontological repositioning toward the social and psycho-emotional model of dis/Ability (Thomas, 1999) or intersectional disablism (Iqtadar et al., 2020) not only alters how we understand dis/Ability as an intersectional phenomenon, but also obviates the problem of overrepresentation.

Overrepresentation and the social and intersectional disablism model of dis/Ability

What precisely does it mean when we say someone has a "disability"? When and how do certain human differences come to be known as "disabilities"? In everyday parlance, having a disability means that an individual is unable to perform physically, cognitively, or socially/emotionally in a manner considered "typical" or "desirable." Yet, words like *considered*, *typical*, and *desirable* are distinctly values-laden interpretations that are, even if unintentionally, laced with idiosyncratic judgments. This means that identifying some people as having "disabilities" signifies their failure to meet established sociocultural and political expectations—even if identifying them as such is intended as a benevolent gesture of aiding and assisting—something that special education has historically done toward BIPOC youth and communities (Coomer, 2019; Thorius, 2019).

Over the years, this informal, common sense, understanding of dis/Ability has been incrementally formalized by professionals who through a process of applying ever more exacting description and quantification have prescribed increasingly specific criteria for defining a whole range of disabilities. This process of formalization took place within the purview of the fields of medicine and psychology, and the emergent understanding of dis/Ability has come to be known as the *medical model* of dis/Ability (Trent, 1994). Viewed through the paradigmatic lens of the medical framework, "disability" is:

- An objective condition (categorizing a person as having a disability is an entirely impartial act).
- Inherent in the individual. The person "owns" the disability.
- A deficiency or form of pathology—thus the remedy for disability is to cure, remediate, rehabilitate (i.e., make disabled people more "normal").
- Note: the medical model, in assuming objectivity, does not view the category of normal, that is, the ideology of normal, as a socio-political category.

By all appearances, this formalization process removed the role of judgment, values, or opinion—presumably reclaiming the identification of disabilities as a politically neutral act and disability itself as an "objective" condition. Even when the role of judgment is acknowledged, it is termed *clinical judgment*, such that the identification process is nonetheless thought to be sufficiently objective enough that most of us tend to think of a disability as an autonomous condition that an individual possesses or "has"—an inherent facet of them (Biklen, 1988). This assumption is apparent in our language when we say, for example, that Kevin *has* a learning disability (or more appropriately, given this approach, that Kevin *is* learning disabled). Or that Keisha *has* a behavioral disorder (or more to the point, given this approach, that Keisha *is* behaviorally disordered). In other words, the assumption that a student's disability is solely a function of their intrinsic characteristics seems self-evidently "true" and generally taken-for-granted.

Still, disturbing suspicions about the integrity of this common sense *within-the-person* assumption confront us in the form of incongruities for which some find themselves quite at a loss to explain. One of the most troubling of these incongruities is the changing and arbitrary nature of disability definitions and identification criteria (Danforth, 2007; Dunn, 1968; Ferri and Connor, 2006; Gallagher, 2010; Kliever and Biklen, 1996). A classic example dates back to 1973 when what is now the *American Association*

on *Intellectual and Developmental Disabilities* (AAIDD) redefined “mental retardation” (now termed intellectual disabilities) by revising the criteria for determining “significant sub-average intellectual functioning” from one standard deviation below the mean (an IQ score of 85 or below) to two standard deviations below the mean (an IQ score of 70 or below). This redefinition precipitously lowered the population of individuals identified as “mentally retarded” from 16% of the overall population to 2.25%, a shift dramatic enough for some scholars to note satirically that it resulted in thousands of students labeled as having intellectual disabilities children magically becoming “perfectly normal.” It is also noteworthy that since its original formalization in 1941, the definition of intellectual disabilities underwent six rather substantive alterations prior to the late 1990s (Smith, 1997).

A very similar situation has surrounded the category of Specific Learning Disabilities (SLD), a special education category that has been with us since Samuel Kirk first coined the term in 1963 (Sleeter, 1986). Its theoretical origins, however, go back several decades earlier when researchers sought to explain the learning problems of students whose low academic achievement could not be explained by the usual factors—low intelligence, cultural diversity, physical/sensory impairment, or emotional complication (Carrier, 1986; Danforth and Ressa, 2013). Crucially, these researchers started from the premise that the learning problems they sought to explain originated in the neurological makeup of individual students—even though the basis of this assumption was simple conjecture based on tautological reasoning. Incidentally, this terrific leap of inference was pointed out *and acknowledged* by the researchers quite early on, but nonetheless ignored (Carrier, 1986). Almost a century later, we have no decisive evidence that SLD are neurologically based.

That is not to say that neurological factors are not involved in learning. Of course, they are. Nor is it to deny that some students require much more time and experience far greater difficulty in acquiring literacy and other academic skills in comparison with their same age peers (although we would add that this is another Eurocentric and ableist foundation or master narrative regarding what counts as a SLD if we understand learning from a cultural-historical developmental approach) (Hernández-Saca, 2016). But this point does not support the presumption of a specific neurological disorder in the absence of knowing far more than we currently know—if indeed such specificity can ever be pinned down or is even desirable from an educational and cultural standpoint. Further, the neurological explanation is far too unidimensional because the intricacies involving how individual neurology intersects with the equally complex webs of the social/cultural, pedagogical, and emotional and we argue spiritual aspects of learning are far, far more complicated.

Our main point here is that even though the neurological basis of learning disability theory is nothing more than an appealing (to some) conjecture at best, it has become lodged in our collective consciousness as a powerful truism. It is also one that leads us to overlook countervailing evidence that should prompt us to reflect more deeply about this special education category. The fact that the definition and identification criteria for SLD have undergone many significant changes over the last several decades (see: Gallagher, 2010) may just mean that this category is an evolving concept we have about some students, not an *in-their-heads* deficiency that some students *have* (Dudley-Marling, 2004).

Elaborating on the distinction between SLD as a personal deficiency versus a culturally/institutionally created identity, Dudley-Marling asserted that:

... learning and learning problems, including the identity of “having LD,” do not reside in people’s heads as much as in the complex of social interactions performed in a place called school that is itself situated in a broader social, political, and cultural context (p. 483).

Pointing specifically to our cultural ethos of rugged individualism, Dudley-Marling noted that students who require more assistance than others are seen inadequate and problematic. Together with:

- The competitive underpinnings of American schooling,
- Our preoccupation with the *rate* of learning over the quality of learning, and
- School tracking and stratifying practices based on the erroneous assumption of achievement as normally distributed.

An emphasis on individualism makes it inevitable that some students come to be viewed as deficient—*not because they are innately so, but because these values and practices make their differences “a problem.”* Finally, quoting McDermott (1993), Dudley-Marling enjoined readers to acknowledge that the failure of some students is created through the rather ludicrous insistence that “everyone do better than everyone else” (p. 274). W.E.B. Du Bois (1903) asked: How does it feel to be a problem? in the early twentieth century. Although, Du Bois (1903) was talking about the two-ness and double-consciousness of Black Americans in the US, at the beginning of the three decades of the 21st century the entanglement between race and dis/Ability has moved us and other critical interdisciplinary scholars of disability to ask the same question: *How does it feel to be placed in special education as a BIPOC youth at your intersections of power and identities and be labeled as a problem?* (See: Artiles, 2013).

None of these institutional values, practices, or beliefs is preordained, nor are they inescapable. Of course, that does not mean that taking on such matters is an easy task. Providing us a good starting place, Dudley-Marling suggested that instead of asking the classic question—“What’s wrong with [Kevin or Keisha],” it would be far more useful to ask—“What’s wrong with an institution that produces so much failure?” along with its corollary question—“What’s wrong with a culture that created an institution that creates so much failure?” (p. 483).

These questions apply not just to SLD but to all other special education categories as well. Most obviously they apply to categories like serious emotional disturbance (SED), or what is commonly termed behavioral disorders (BD), and Attention-deficit,

Hyperactivity Disorder (ADHD) (both of which are categories whose definitions and identification criteria continue to shift and change even while students are regularly identified as “having” these conditions). But they are also just as relevant to the so called “low incidence” special education categories, including those which involve physically visible impairments. Most importantly, these questions point to an entirely different perspective on the nature of dis/Ability and what it means to be dis/Abled.

At its core, the difference between the medical model of disability and its social and psycho-emotional and intersectional disablism model contender boils down to whether disabilities *exist* as ontologically *real* conditions in the sense that they are intrinsic to the individual, can be quantified, and are properly grounded in the logic of ability as normally distributed. The medical model affirms this perspective, while the social and psycho-emotional and intersectional disablism models holds that dis/Abilities are the product of social interpretations of various human differences at the intersections of power and identities (and that BIPOC dis/Abled folks experience psycho-emotional disablism that constrains their well-being and agency due to the social construction of what counts as dis/Ability in educational contexts across K-16 and beyond) (Iqtadar et al., 2020). Simply put, the social and intersectional disablism model supports the position that disability is a social construct or an *idea* about the nature of certain kinds of human variation that imposes socially originated constraints on the well-being and agency of BIPOC youth that they actively resist (Kliewer and Biklen, 1996; Iqtadar et al., 2020). In other words, across K-16 educational spaces, BIPOC youth have resisted and are agentive against the hegemony of special education labeling, classifications, and identifications as white neoliberal property (Kearl, 2019; Iqtadar et al., 2020). Further, the social and intersectional disablism models call for transformations of our cultural, educational, physical, affective and relational environments at the personal, interpersonal, structural, and political dimensions (Crenshaw, 1990). This resistance also calls for accessibility and inclusion along all dimensions of our society, both internal and external.

It is important to note here that the social and the intersectional disablism model of disability does not pretend that human differences are non-existent or are merely figments of our imagination. What they do ask us to consider is why those differences *make a difference*—or more to the point, it asks us to account for how we *make* some people’s differences problematic. That these differences do exist is one thing, but how we interpret and respond to them is another matter altogether. Applying the social and the intersectional disablism model also does not mean that,

... society should not value activities that some of its members cannot engage in; it is harmless to value the capacity of sight that permits people to behold Rembrandt’s masterpieces, sunsets, or the faces of family members and friends. It is not offensive to prize intellectual accomplishment, athletic prowess, or the ability to appreciate visual beauty and to regret that not everyone we know can enjoy them. To the extent that spina bifida, Down syndrome, blindness, or cystic fibrosis currently precludes people from undertaking some parts of life that people who do not have those traits might experience, the disability critique [the social and intersectional disablism model] acknowledges that disability puts some limits on the “open future” people seek for themselves and their children.

Parens and Asch (2000, p. 25).

We already know that not all students can master the intricacies of advanced calculus or write beautifully crafted essays on Shakespeare’s *King Lear*. And although we continue to value these capabilities, it is crucial that we also make the educational arrangements and pedagogical changes that will allow *all students* to experience the joy of understanding and the intense satisfaction of thinking deeply about things that matter.

Holding high standards for all students does not mean holding the same standard for all students: this is at the heart of privileging equity rather than only equality. Nevertheless, we need to move beyond binaries in order to achieve both/and equity and equality. We also need to do so in order to live out the spirit of the Equal Educational Opportunity (EEO) Act of 1974 in our everyday practices not only within the classroom but also in conducting educational research. Furthermore, this legal construct of EEO, encoded into the Elementary and Secondary Education Act of 1964 asserts that researchers and all agents within the public educational system must hold the complexity of such paradoxes through the love and spirit of learning—with teaching and education as our task at hand as we educate BIPOC youth with and without dis/Abilities. In doing so, we can pay back the educational debts (Ladson-Billings, 2006) that since the founding of the country have been due to historically multiply marginalized groups such as BIPOC youth.

From a social and intersectional disablism model perspective, the relentless attempt to “catch students up” with their so called “normal” peers is both self-defeating and damaging. Equally defeating are the ranking, sorting, selecting, and stratifying activities to which we educators devote so much time, energy, and scarce fiscal resources. Not much reflection is required to recognize that making invidious comparisons among our students contributes little to the goal of educating them. And knowing what individual students need from their teachers does not hinge on how much better or worse they “perform” in any given subject area compared to other students. Put differently, seeing to it that every student is afforded the conditions to become as knowledgeable, as skilled and as caring as possible does not require comparing them to one another. It does not involve labeling some of them. And, finally, an end to special education disability labeling, classification, and identification policies and practices or master narratives (Hernández-Saca, 2016) also means an end to the problem of overrepresentation in special education.

Conclusion

It is not coincidental that research seeking to minimize the problem of overrepresentation has relied on methodological neutrality to do so. This stance is inherently a politically conservative one, "... in that it inevitably must leave the school and social structures basically intact" (Smith and Gallagher, 2008, p. 292). It is a stance that allows, and in fact requires, *researchers to look outside of themselves for technical solutions that never really resolve the problem*. And very importantly it is one that promises, misleadingly, to cordon off researcher bias along with racist and ableist policies and practices—including the researcher's culturally and historically contingent baggage surrounding deeply fraught issues like race and dis/Ability. The main point here is that the researcher's values, interests, and ideological commitments cannot and should not be avoided in the pretension of a neutrality that cannot in any event be achieved (Arzubiaga et al., 2008; Gallagher, 2006). Researchers' conceptual frameworks are not devoid of their personal goals, ideological commitments, identities and positionalities (Ravitch and Riggan, 2017). On the contrary, they must serve as the starting point for the research process (Ravitch and Riggan, 2017). In the end, there is no methodologically privileged, easy way out if we truly want to abolish the deeply entrenched racist and ableist injustices we face as educational equity researchers. The time has always been now to anchor and connect the larger historical-sociological patterned inequities and inequalities faced by BIPOC youth and communities to achieve morally, spiritually and politically catalytic praxical actions for justice for all. What are we waiting for and what are we so afraid of? (Bell, 1995).

The core business of exclusion

Call me a contrarian, but there is something of a paradox afoot pressing us to question the authenticity of inclusive education's reception and application. Let me explain—explain this paradox's foundations, its inevitability and the shadow it casts over the future of education. *Inclusive Education* has established itself in education's official lexicon (Wallace, 2009). It has, in my academic lifetime, insinuated itself as a motif for—or mantra in—education policy and practice. It now occupies growing sections on library and publishing house shelves and catalogs and has secured sizable national and global research funding envelopes. Education practitioners, researchers, administrators, consultants, and activists circumnavigate the globe in search of comfortable convention centers to share their aspirations for an inclusive “education for all”. Education Ministers and their Secretaries (aka Director-General) declare inclusive education as an educational aspiration that is simultaneously their stated organizational and pedagogic strategy for improving educational experiences and outcomes for all. Legislation, administrative regulations, international conventions, charters and memoranda of understanding stack-up and are referred to as the legitimizing platform for inclusive schooling. Trans-national supra-organizations such as UNESCO (2020, 2022), the OECD (Cerna et al., 2021), The World Bank (2020), the Asian Development Bank (2022), Open Society Foundation (2019), the Brookings Institution Sengeh and Winthrop (2022), Save the Children (2014) and the International Monetary Fund Filmer et al. (2021) have all signed up to the cause as their recent reporting and project listings reflect.

Other *key indicators*, applying the language of our time, may be readily assembled to support the proposition that inclusive education is more than a rhetorical flourish. Many children who would otherwise be engaged in unremitting manual labor in clothing sweatshops, on village farms or in a multitude of factories in countries where the struggle for daily subsistence proscribes childhood dreams are finding their place in classrooms. Girls who would have been married as children and not received their right (United Nations Convention on the Rights of the Child, 1989: see Articles 23, 28, 29) to basic education are being sponsored by NGOs or their communities to complete their schooling. Disabled children, once protectively hidden by parents at home or gathered in specially designated special schools, are being encouraged to attend their neighborhood school with their brothers, sisters and neighborhood friends. Children living in poverty are targeted, “targets” being another of *eduspeak's* default vocabulary, for *leveling-up*.

I don't mean to appear cynical or derisive. Nor do I want to devalue progressive gains for children who would otherwise continue to be excluded from their right to an education. To be sure, people of good-will are dedicated to securing inclusive and excellent educational experiences for more children through a range of reforms to the modern educational edifice. Clearly, more children are attending schools than was the case just a handful of decades ago. This ought to be cause for celebration, not hesitancy. Many say the successes of inclusive education policies and programs should form the catalyst for continuing educational reform (Ainscow, 2016). An erstwhile school reformer, I want to kick away the shadow of doubt and struggle on. This struggle has become harder. Perhaps it is pandemic, perhaps advancing years. The combination of institutional intransigence, discrimination and chicanery form a belligerent foe. The weight of doubt sits heavier than the accelerant of optimism.

Like many others I was drawn back to Albert Camus' classic novel of pestilence: *The Plague* (*La Peste*), when living around the corner from Harrogate's emergency 500 bed Nightingale Hospital that had been opened by Captain Sir Tom Moore in April 2020 to relieve anticipated surges of COVID-19 pressure at the local National Health Service hospital. Soon after, in March 2021, it closed having not treated a single patient. Nevertheless, passing it on my daily walk, it stood as a silent sentinel; it's two giant oxygen tanks casting foreboding shadows. The building was shrouded in white hessian and security guards loitered in clusters around its perimeter. As the ambulance sirens wailed at night my imagination filled those 500 beds (Fig. 1).

Let's return to Camus and the inhabitants of the Algerian coastal township of Oran where *The Plague* is set. The novel follows the deleterious impacts of bubonic plague on the relationships between the inhabitants of this pandemic-ravaged township. It is a chronicle of social atrophy. The novel is of course allegorical. For Camus the plague represents fascism. In this respect, the populist formations of the far right remain a threat to civil society (Harnish, 2017; Camus and Lebourg, 2017; Castells, 2018). The novel ends

Fig. 1 NHS Nightingale Hospital Yorkshire, Harrogate

with the disappearance of the disease-carrying rats, the diminution of infection and the emergence of the town's survivors in the throes of revelry. An exhausted Monsieur Rieux, the doctor whom we have followed in his heroic fight against the plague, makes his way home slowly walking, bearing the weight of foreboding.

Indeed, as he listened to the cries of joy that rose above the town, Rieux recalled that this joy was always under threat. He knew that this happy crowd was unaware of something that one can read in books, which is that the plague bacillus never dies or vanishes entirely, that it can remain dormant for dozens of years in furniture or clothing, that it waits patiently in bedrooms, cellars, trunks, handkerchiefs and old papers, and that perhaps the day will come when for the instruction or misfortune of mankind, the plague will rouse its rats and send them to die in some well contented city.

Camus (2013: 331–332).

The paradox to which I refer is the resilience of educational exclusion. It lurks, mostly unspoken, behind and within any discussion of inclusive education. The problem is not just its omnipresence. Although, that is a monumental problem to be considered further in this chapter. Exclusion is a part of the DNA of schooling, deeply embedded in its architecture and often difficult to detect (Slee, 2018). In a recent paper entitled *Against School: an epistemological critique*, Ball and Collet-Sabe (2021) enlist Rogan (2017) treatise on the moral economists to suggest that examinations of schooling, like most economic debates, have been distracted by technical issues concerning the effects of schooling. Who are the winners? Who are the losers? How do we create more winners with minimal change to the structure and culture of schooling? Thereby, the fundamental question about the moral legitimacy of the institution in and of itself escapes interrogation.

Rogan's point is that the critique of capitalism in the twentieth century shifted away from a fundamental demolition of its "moral and spiritual desolation" to a single-minded focus on the calculation of the relative advantages and disadvantages it generates—a shift from "Is it morally wrong?" to "Does it have bad outcomes?"—Who wins and who loses? We want to suggest that the critical tradition in education and criticism of the school by sociologists and others has suffered a similar displacement or avoidance of moral argumentation by calculative evaluation.

Ball and Collet-Sabe (2021: 1–2).

This chapter, mindful of Ball and Collet-Sabe's (2021:3) observation that reforming an "intolerable and irredeemable" institution of "moral and spiritual desolation" is a futile modernist project, is divided into three parts. First is a truncated discussion of inclusive education; what it is and why there exists a need for *disability studies in education*. Second is a brief re-examination of exclusion and schooling. And finally, I will tentatively commence what must be an ongoing discussion of whether reform is an exercise in futility or a cry of hope.

Inclusive education: reconsidering recurrent themes?

Rather than offering yet another incomplete chronology of inclusive education (Slee, 2018b), I will outline two recurring questions:

1. What is inclusive education?
2. Given the surging acceptance of inclusive education, why our insistence on disability studies in education?

My aim is to support the more nuanced discussion (Thomas and Loxley, 2022) of the possibilities and limits of school reform.

What is inclusive education?

In general terms inclusive education is defined as any policy, program or practice aiming to increase access, presence, participation and success for all students in education. Accordingly, attempts to identify and dismantle barriers to education for all students constitute inclusive education. It's as simple and as complex as that. But let's explore this proposition a little further as it is obvious that exclusion is contingent. It is formed and shaped within a matrix of historic, political, cultural, geographic, economic elements and by varying conceptions of the correct purposes, organization and delivery of schooling.

Since the invention of modern schooling there have been successive attempts to understand the differential impacts of schooling on diverse population cohorts, to extend provision for more students and to improve their educational experiences and benefits. We see this in the "new sociology of education" (Apple, 1979, 1982; Bernstein, 1970, 1973; Young, 1971; Bourdieu and Passeron, 1977; Whitty, 1985). Such work debunked the liberal myth of meritocratic schooling and its claim that hard work and talent trumped class and other identity markers such as gender, race, first nations, minority cultural or religious affiliation, or perceived disability in the distribution of educational opportunities and rewards. Sandel (2020) has returns us to an examination of the tyranny of merit in a discussion of buying university admissions in the US

In an unequal society, those who land on top want to believe their success is morally justified. In a meritocratic society, this means the winners must believe they have earned their success through their own talent and hard work.

Paradoxically, this is the gift the cheating parents wanted to give their children to live in affluence, they could have given them trust funds. But they wanted something else—the meritocratic cachet that admission to elite colleges confers.

Sandel (2020: 13).

The new sociology of education challenged deterministic psychological explanations of intelligence, heritability and educational achievement, dismissing the resurrection of risible claims that failure could be linked to the inferior intelligence of the working class and people of color (Hernstein and Murray, 1994) and heightening our awareness of the contingent nature of educational opportunities and outcomes (Ball, 2006; Gillborn, 2008; Tomlinson, 2013, 2017; Tait, 2018). Put simply, different students receive different deals from education. Some students are privileged, others are not. The assignation of educational success and failure is not random (Teese, 2013).

In his examination of stratification in schooling, American criminologist, Polk (1984) describes *sponsored* students and *the new marginal youth*, or those whom Bauman (2004: 39) would call the *surplus population of liquid times*. Obvious barriers to access and participation in schooling are apparent in the countries of the global south when compared with those of the global north (UNESCO, 2020; Pather and Slee, 2019). Widening disparities in participation and attainment are also obvious within affluent countries along the fault lines of privilege and poverty (Connell, 1993; Dorling, 2018; Lamb et al., 2015, 2020). "All societies", Bauman instructs, "produce their own set of strangers; but each kind of society produces its own kind of strangers and produces them in its own inimitable way" (1997:17).

Targeted reforms and compensatory education programs (Rizvi and Kemmis, 1987; Connell et al., 1992; Rizvi, 2013) have been, and continue to be deployed by jurisdictions to mitigate disadvantage. Such interventions are built into jurisdictional funding models (Deloitte Access Economics, 2017; Department of Education, 2022) and augmented through specific programs. Notwithstanding, these periodic tilts at redistribution, "education equality is always proclaimed, never realized" (Picketty, 2022: 176). The "concentration of expenditures for education to the benefit of a minority is, to be sure, less extreme than it used to be, but it remains considerable, and is hardly in conformity with contemporary talk about equality of opportunity" (Picketty, 2022: 179–180).

Tracing the origins and development of inclusive education is fraught. Some may return to the introduction of mass schooling and track forward (Tait, 2018), others might suggest that civil rights legislation such as *Brown v. Board of Education Topeka* (1954) in the US together with international agreements and declarations such as the UN Convention on the Rights of the Child provided the impetus for inclusion for all. Danforth (2009) returns us to special education activists who refused to accept the proposition that disabled children were ineducable. In doing so, he exposes tensions between a spirit of radicalism and the conservatism of the structures and cultures of schooling that accommodated its application so as not to unsettle the status quo. Of course, such accommodations drew and protected clear boundaries.

Attempts to locate the source of inclusive education as an international education policy imperative often return to the *World Education Conference on Education for All* in Jontiem, Thailand in 1990 (UNESCO, 1990). Delegates gathered from around the world to consider strategies for removing barriers to education emanating from: poverty; conflict; population displacement; “natural” and climate disaster; gender; child labor; child marriage; ethnic, religious, linguistic and or tribal affiliations; disability; gender and their intersections. Herein we see the origins of the “*Education for All*” movement. Of course, within the assembled delegates, specific groups and individuals were concerned with specific renditions of exclusion (e.g., the exclusion of girls and women; the exclusion of the poor; the exclusion of “minority” races and ethnicities; the exclusion of the disabled; the exclusion of first nations peoples; the exclusion of children of travelers, refugees and asylum-seekers). For those who were primarily concerned with the education and the exclusion of disabled students, the follow-up conference on special needs education in the Spanish city of Salamanca over 25 years ago in 1994 (UNESCO, 1994) is seen as a watershed event. The *Salamanca Statement and Framework for Action on Special Needs Education* was endorsed and adopted by the 92 represented governments and 25 international organizations from around the world. It was jointly released by UNESCO and the Spanish Ministry of Education. It is important to note two of the principles set out in the *Salamanca Statement and Framework for Action on Special Needs Education*:

- Those with special educational needs must have access to regular schools which will accommodate them within a child-centered pedagogy capable of meeting their needs.
- Regular schools with this inclusive orientation are the most effective means of combatting discriminatory attitudes, creating welcoming communities, building an inclusive society and achieving education for all; moreover, they provide an effective education to the majority of children and improve the efficiency and ultimately the cost effectiveness of the entire system.

UNESCO (1994: viii & ix).

Reflecting on the creation and legacy of the *Salamanca Statement and Framework for Action on Special Needs Education* some 25 years later Ainscow et al. (2019) observe that:

The publication of the Salamanca Statement suggested a significant change in policy direction, not least for the education of disabled students. However, the document contains some ambiguities that have become apparent when used in the field. In particular, the deficit orientation of special education discourse continues to undermine more radical moves, as argued in some of the papers. Indeed, this conservative discourse has protected resistance to the reforms it foreshadowed.

Why our insistence on disability studies in education?

An impression I have formed is that there has been a systematic move across the special education industry to rebrand itself. Although I have not yet amassed sufficient data to *scientifically* substantiate this impression, others have worked toward this (Brantlinger, 2006; Tomlinson, 2017). There has been a maneuvering to merge the discourses of special education and inclusive education to forge a view of common purpose and practice in the service of inclusive schooling. Repetition and saturation suppress any audible intake of breath when we encounter astonishing phrases such as “*reverse inclusion*”, or “*inclusive special education*”, or read course descriptions for postgraduate awards in *special and inclusive education*, or hear a headteacher, Special Education Needs Coordinator (SENCO) or in Queensland a Head of Special Education (HOSE) direct us to the inclusion room where all of the disabled students take their lessons, or even read of an education jurisdiction in Australia awarding its *Showcase Award for Excellence in Inclusive Education* to special schools. A confluence of factors may surreptitiously contribute to the irony of celebrating separate special schools as exemplars of inclusion. At play is a powerful teachers’ industrial organization that continues to frame the education of disabled students as an industrial working conditions issue rather than as a political question of overdue organizational reform to dismantle ableism. There is a strong special schools administrators’ lobby and historic commitment to an individually based categorical model for distributing support which has had longstanding perverse effects (Deloitte Access Economics, 2017). Put simply, through a series of linguistic and organizational adjustments, there are in 2022 powerful vested interests maintaining educational disablement just as there were when Tomlinson (1982; 1985) wrote her then radical sociological analyses of special education.

Inclusive education has become a catch-all term for a broad spectrum of practices including the building of new separate special schools, the refurbishment of existing special schools, the co-location (typically with clear lines of division—see Walker, 2019) of special and regular schools, visitations of non-disabled children to special schools and classrooms to familiarize themselves with and befriend disabled children, the renaming of special schools as *specialist schools* to merge into the landscape of specialist science schools, specialist arts schools, specialist music schools, specialist golf schools. A legacy of Dame Mary Warnock’s *Report of the Committee of Enquiry into the Education of Handicapped children and Young People* (DfES, 1978), children, teachers, rooms, units, buildings, training courses, curriculum consultants—the list is too long to complete—all gather under the title of *special educational needs* (Slee, 2018). Of course, the administrative insignia: *special educational needs*, echoes assumptions of individual defectiveness adhering to the tradition of special schooling and the expansive industry that formed around it (Tomlinson, 2017). Repetition in usage (Bourdieu, 2014) transformed special educational needs to an institutional truth.

Anti-racist education researcher and activist, Barry Troyna pressed English Local Education Authorities and schools in the 1980s and 1990s to resist liberal displays of *multiculturalism* such as the celebration of *saris*, *samosas* and *steel bands*. Such displays deflect from institutional racism and the minutiae of assimilationist practices in white British schooling (Troyna, 1993), providing a protective veneer for racism. Enlisting Critical Race Theory (Gillborn, 2008; Ladson-Billings, 1995) to interrogate the ontologies and

epistemologies of *whiteness* or racism in education is the first step in working toward an inclusive education for these Black British or Asian students. So too for deconstructing disabling school cultures and practices. Traditional special educational conceptions of disability and impairment support ablest or disabling schooling. Enablement requires a different ontology and epistemology, and this has profound implications for: what we teach; how we teach; how we assess; how we physically arrange schools and classrooms; how we understand the nature and purpose of schooling; how we perceive and respond to diverse student populations; how we educate teachers; how we re-educate teachers; how we distribute resources and support across education jurisdictions (Morton and Guerin, 2017; Gallagher, 2010).

No doubt, this chapter will be read as an attack on special education. Such a reaction is reductive and misses the point. Special education is one element of a constellation of educational provision. Special education exists because of the structures and cultures of schooling at large. The erstwhile co-dependence of regular and special schools continues to support the surveillance, calibration, categorization and subdivision of students *in their best interests* (sic) and of course in the interest of the stable organization and administration of schools. I return to Ball and Collet-Sabe (2021: 3):

... the problem is not with the ambitions of goodness, but its vehicle—the school and schooling, as the default signifiers of education. The project of inclusion mis-reads the school as a site of opportunity and possibility, and we are always disappointed (Slee, 2018). The essence and *raison d'être* of the school is in fact normalisation and perversely inclusion may contribute to that end.

The rhetoric of *special educational needs* returns us to the assumptions, traditions and practices of defectology, the outcome of which is ableism and the continuing temporal, cultural and spatial separation of disabled students. The response requires more than a change of vocabulary, or the provision of “safe spaces” in which to congregate disabled students in mainstream schools, it requires changes to the foundations of how we know, speak and operate in our world (Rix, 2015; Thomas and Loxley, 2022). Accordingly, the move from special education, and axiomatically regular schooling, to disability studies in education is overdue. Borrowing from Said (2000: 236–237), it may be that inclusive education, having been *tamed and domesticated*, has lost its *insurrectionary zeal*.

Exclusion: a petite reprise

It is beyond the scope of this chapter to forensically describe and analyze educational failure and exclusion, their antecedents and effects. Having already acknowledged the antiquity and ubiquity (Slee, 2011) of educational failure and exclusion, the intention here is to suggest two constitutive features of exclusion as a prelude to remarks on the possibilities of and limits to school reform. Since we have been concerned with the education of disabled students, I will also draw on recent observations about their experiences of schooling in Australia.

Prior to the grip of the COVID-19 pandemic, UNESCO (2019) reported 258.4 million children excluded from school due to a range of intersecting factors reflecting divisions along the fault-lines of privilege and disadvantage. Director-General, Audrey Azoulay revised this estimate suggesting that with temporary school closures because of COVID-19, the numbers of children out of school had reached 290 million. Educational marginalization and exclusion is contingent (UNESCO, 2020). Here I will present just two features of educational exclusion: *structural features* and *cultural features*. Of course, this presentation is constructed to order the discussion because the reality is the messy collision of these features.

As we have already observed, schooling is the boiler-room for the reproduction of inequality (Apple, 1982, 1990; Dorling, 2010; Picketty, 2022). In his recent appraisal of the education system in the UK Sam Bright (2022: 17) is unambiguous:

Elite, fee-paying institutions have funnelled students into the upper echelons of business, law and politics for centuries—a rigged system that the Labour Party has variously attempted to knobble, with little success.

England is not unique. The structure of school funding across and within jurisdictions illuminates fundamental inequalities in the material conditions of schooling that have direct impacts on educational opportunities and outcomes. Here we may be referring to the differences between a school with a technology rich theater and rehearsal spaces, with science laboratories or with sports stadia in a leafy suburb in the Eastern suburbs of Melbourne and the windowless, dirt floored room in rural Ethiopia where 90 children attend to their teacher at the small blackboard. In one such school a principal showed me a multi-function printer in his office that had been donated by an NGO. Still in its wrapping and box, it was of little value to a school without electricity and the other basic accoutrements of a contemporary school. Even within affluent countries, we see *savage inequalities* (Kozol, 1991). The funding of schools in affluent countries reflects and reproduces educational inequality and disengagement (Lamb et al., 2020; Wilkinson and Pickett, 2010; Connell, 1993). The supplementation of parent fees in imprecisely described *private* or *independent* schools through general taxation revenue reflects the “trickle-up economics of education” (Slee, 2018). The divisions of privilege and disadvantage are clearly manifest in the structure of material resources, but it also privileges and attenuates curriculum and pedagogy (Teese, 2013; Lamb et al., 2020).

The second feature of educational exclusion is both structural and cultural. Education is the site of intense competition (Ball, 2017). Using international testing programs, national school systems compete against each other to secure higher ranking positions on international performance tables. Many jurisdictions have their own renditions of student performance testing with elaborate ranking systems to record and broadcast the performance of states, regions, provinces and individual schools. To support achieving higher standards, jurisdictions apply additional measures for auditing schools and their performance across several domains. Incentives and sanctions are used to assist schools to improve their performance. Achievement is rewarded, underachievement is not. Schools are locked into competition against each other. The logic is compelling, the practice is complicated and often traumatic (Ravitch, 2014; Luff, 2021). The important point for this discussion is that performance against the criteria of the testing programs and the school audits directly impacts on the profile, funding and futures of schools in the educational marketplace (Ball, 2017). Schools with higher performance rankings are more heavily subscribed to and exercise choice over their student profile to protect their ranking. In this climate students become the *bearers of results*. The modern educational marketplace fosters an ethos of competitive individualism. Parents, students, teachers, and schools lock into a competition that inevitably must produce failure and exclusion, winners and losers (Ravitch, 2020).

Accordingly, we have seen schools applying what Gillborn and Youdell (1999) referred to as “educational triage” to determine which students would add value to the school’s profile and which students presented a risk to investment. Students are more and less attractive, more or less risky for increasingly risk-averse schools. Managing diverse populations who challenge institutional order and performance takes various forms. We have seen the continuing rise of school exclusions and diversion of disengaged and disruptive students to off-site centers, referral units, and alternative programs (Mowatt, 2022). Many jurisdictions manage diversity, difference and disengagement through their special educational needs or additional needs protocols and practices (Slee, 2011). The absence of the unskilled labor market to absorb the failure of schooling has coincided with the increasing diagnosis of students with an expanding range of syndromes (Tait, 2010; Harwood and Allan, 2014; Rose, 2007). Schools and teachers are being instructed in the application of DSMV to managing classrooms (Tobin and House, 2016). The requirement for more special programs and personnel has its own gravity (Tomlinson, 2017; Rose, 2007).

Disabled children and schooling in Australia: systemic failure

Following a highly publicized case in the Australian Capital Territory of a child with autism being restrained in a purpose-built cage (called *The Sanctuary*) within a classroom storage area (Lawson, 2015; Macdonald, 2015), a review of educational provision for students with complex needs and challenging behavior (Shaddock et al., 2016) was commissioned. Further complaints about restraint and seclusion followed in other jurisdictions. Successive reports of inquiries and reviews converged in presenting evidence of the negative experiences of disabled children (Deloitte Access Economics, 2017). An Australia-wide Royal Commission into Abuse, Neglect and Exploitation of People with Disability was convened in April 2019 (Royal Commission into Abuse, Neglect and Exploitation of People with Disability, 2019). The Royal Commission held a public hearing in November of that year for four days in the northern Queensland city of Townsville to gather evidence concerning:

1. Inclusiveness in education as it relates to students with disability; and
2. The implementation of existing policies and procedures relating to inclusive education of students with disability, with focus on the Queensland government education system.

Royal Commission into Abuse, Neglect and Exploitation of People with Disability (2020: 5).

The expert witness evidence to the Royal Commissioners has been published in an Interim Report from the public hearing (Royal Commission into Abuse, Neglect and Exploitation of People with Disability, 2020) (Table 1). Following is an indicative list of nine areas of complaint:

Damaged or design fault?—fixable or irredeemable?

I return to the resilience of exclusion in what has been described as the “*age of inclusion*” (O’Keefe, 2004). Do we shuffle along the continuum of school reform as we have for decades? Condemned at the end of each initiative to plug the leaks and seal the cracks, rebranding the next round of fixatives?

In other words, the school, and education as currently conceived and represented by the school, as a site of equity, is a lost cause. That is, despite all the debates around segregation, inequality and exclusion, despite or because of innovation, what is sought, desired and struggled for in movements of school reform, of virtually all sorts, is not something different but rather another version of the same thing, using the same architecture and paraphernalia that provide for and deliver, in new and old ways, division, exclusion, normalisation, and categorisation.

Ball and Collet-Sabe (2021: 3).

Over three decades ago, the English sociologist John Furlong asked why has, “... despite its popularity in academic circles the impact of the sociological perspective on policy (on student disaffection and disruption) ... been negligible” (1991: 293)? “... ”

Table 1 Areas of complaints about education raised with the Royal Commission into Abuse, Neglect and Exploitation of People with Disability, 2020 (Australia).

1. Gatekeeping	Refers to the practice of refusing entry for a student with disability or persuading them to attend another school or special school.
2. Overrepresentation in Student Disciplinary Absences & Unique Attendance Schedules	Students with disability are more likely to incur student disciplinary absences (suspensions/exclusions). Some schools were setting unique schedules of attendance for students with disability.
3. Problems with Making Reasonable Adjustments	The disability discrimination Act requires that schools make “reasonable accommodations” to enable a child with disability to attend and participate in schooling. Parents complained that the adjustments were too frequently not forthcoming.
4. Bullying & Mistreatment	There were reports of bullying of children by non-disabled children and mistreatment by teachers and other adults.
5. Restrictive Practices & Seclusion	Reports of nature, frequency and misapplication of restrictive practices and seclusion of children with disabilities.
6. Low Expectations & Underachievement	Endemic lowering of expectations and problems with curriculum, pedagogy and assessment.
7. Inadequate Teacher Preparation.	Teachers, school principals and parents presented concerns about the amount, nature and quality of preparation for inclusive education.
8. Funding Gaps and Inappropriate Resourcing Models.	Funding models have historically had perverse and unproductive effects. Largely based on diagnostic categories.
9. Inadequate & Ineffective Complaint Resolution Procedures.	Unequal power relations are reinforced through complaints and appeals processes which accentuate adversarial relationships.

the individualized, psychologically orientated approach stills holds sway in most parts of the educational profession” (Furlong, 1991: 293). In what remains a seminal essay, he suggested that in part, it could be attributed to inadequacies in sociological research. Accordingly, he constructed an investigation of the production of the structures of ability, values and occupational identity to offer a nuanced model of human personality to generate more strategic and hopeful levers for the engagement and inclusion of marginalized students.

Twenty-five years after the publication of Furlong’s working through a theoretical impasse Beck’s (2016) *Metamorphosis of the World* was published posthumously. Prior to so much as a whisper of the COVID-19 and pandemic that was ahead, Beck (2016: 3) wrote as “an attempt to rescue myself, and perhaps others too, from a major embarrassment”. As a spectator of the global events revealing themselves on television, he felt at a loss to provide a satisfactory explanation for this “*unhinged world*” with the sociological tools he had hitherto relied on. Streeck (2016), considering the end of capitalism, takes up the challenge issued by Burawoy (2005; see also 2021) in his Presidential Address to the American Sociology Association; namely the challenge to explore the public mission of sociology. Streeck (2016: 237) was fascinated “... with the contrast between the progressive decay of the politics and economy in the United States and the star-studded social sciences departments from Harvard to Stanford”. “*What was all this brilliance good for?*” he asks.

Hauling the economy back into society, and indeed into sociology, may be a programme for which one could today find allies, in a world in which states are about to be turned into something like public corporations having to earn the confidence of capital givers; in which international organisations function as deposit insurance or debt collection agencies on behalf of private investors; and governments begin to resemble corporate managements pressed to extract “creditor value” from citizens turned into workforces disciplined by capital markets (p. 250).

He calls for sociology to ready itself “*for the moment in which the foundations of modern society will again have to be rethought*” (p. 250). Streeck’s prescience is noteworthy when reflecting on such moment-inducing recent crises (*Sattelzeit*) including, global pandemic; the electoral victory and defeat of Trump and the attack on Capitol Hill; Putin’s invasion of The Ukraine and its multiple and far-reaching impacts including the threat to food security for the world’s most vulnerable populations; deepening environmental disasters; successive waves of population displacement and the turning away of those who could and should provide refuge.

Surveying inclusive education policy and practice, special education and the experiences of disabled students over recent decades simultaneously reflects the progress of social movements, trends in education administration, and the inevitability of the institutional failures of schooling. Where once educators spoke without second thoughts of a bifurcated school system comprising regular and special schools, we have seen fragmentation, niche branding around curriculum specializations or identity markers, academisation, the growth of independent state schools and charter schools within that part we described as regular. Alternative educational provision continues to grow, including rises in home-schooling. Special schools, having commissioned sign-writers, are more than

likely to be specialist schools or some are centers for educational inclusion. The special or regular school debate has long been beside the point. This may be the moment to commence our thinking, with new intellectual tools, about reconstructing the task of educating ourselves and our children and applying these tools to a new imaginary that is fit for the times we live in.

EDITORS IN CHIEF – BIOGRAPHIES

Robert J Tierney

Rob Tierney is an international educator whose passion is for developing research partnerships to address local literacy needs with educators in different countries. Rob began his career as a classroom teacher in Australia, then proceeded to work in the United States, Canada, Australia and China. He is Dean Emeritus and Professor Emeritus of Language and Literacy Education at the University of British Columbia, the former Dean and Honorary Professor of the Faculty of Education and Social Work at University of Sydney, and a Distinguished University Professor at Beijing Normal University. In the United States, he has served on the faculties of the University of Illinois, University of Arizona, The Ohio State University, Harvard University, and the University of California. Rob has written a number of books and numerous articles on literacy especially related to global issues, diversity, and literacy development. His most recent book was entitled *A History of Literacy Education: Waves of Research and Practice* published by Teachers College Press in 2021. During his tenure as an educator, he has served as the President of the International Literacy Association, President of the Literacy Research Association, an Editor for the *Reading Research Quarterly*, the President of the Association of Canadian Deans of Education/ L'Association Canadienne des Doyens et Doyennes d'éducation, as well on a number of committees and boards for professional groups and government and nongovernment

agencies. In addition, he has been involved on a range of groups on projects globally including in Africa and Asia including for UNESCO, Children's Television Workshop, and Apple Computer.

Fazal Rizvi

Fazal Rizvi is an Emeritus Professor of Global Studies in Education at the University of Melbourne, as well as at the University of Illinois at Urbana-Champaign. He is also a Visiting Professor at the Universities of Turku in Finland and Pretoria in South Africa. He has written extensively on issues of identity and culture in transnational contexts, globalization and education policy, and Australia-Asia relations. He has published widely, and his book, coauthored with Bob Lingard, *Globalizing Education Policy* (Routledge 2010) is used widely in courses around the world. A sequel to this book, *Reimagining Globalization and Education* (Routledge 2022) has been published recently. Fazal is currently researching educational reform in Bhutan. He is a Fellow of the Australian Academy of the Social Sciences, a past Editor of the journal, *Discourse: Studies in Cultural Politics of Education*, and a past President of the Australian Association of Research in Education.

**Kadriye Ercikan**

Kadriye Ercikan is Vice President of Research and Measurement Sciences at the Educational Testing Service and Professor Emerita at the University of British Columbia. She is responsible for ETS's foundational and applied research and psychometric support of ETS's major testing products and contracts, and the NAEP contract for ETS. Her research focuses on validity and fairness issues and sociocultural context of assessment. Her recent research includes validation of score meaning using response processes, use of response process data for comparing groups and examining fairness and validity of interpretation, and use of scores from artificial intelligence-based automated scoring.

Ercikan is a Fellow of the International Academy of Education. Her research has resulted in 6 books, 4 special issues of refereed journals, and over 100 publications. She was awarded the AERA Division D Significant Contributions to Educational Measurement and Research Methodology recognition for another

coedited volume, *Generalizing from Educational Research: Beyond Qualitative and Quantitative*

Polarization, and received an Early Career Award from the University of British Columbia. Ercikan has been selected to serve as the NCME Book Series Editor (2021–2026).

SECTION EDITORS

Jason Beech is Associate Professor (Global Policy) at the University of Melbourne and visiting professor at Universidad de San Andrés in Buenos Aires where he holds a UNESCO Chair in Education for Sustainability and Global Citizenship. He is senior researcher of the National Council for Scientific and Technical Research of Argentina (CONICET), and Associate Editor of *Education Policy Analysis Archives*. He has been a member of the Board of Directors of the Comparative and International Education Society (2014-2016). Jason has published extensively on the globalization of knowledge and policies related to education. He has also written and is passionate about the challenges of educating for global citizenship and a sustainable future. He has taught in several universities in the Americas, Europe and Australia.

Professor Qing Gu is Director of the UCL Centre for Educational Leadership and Professor of Leadership in Education. She is the Past Chair of the *British Association of Comparative and International Education* (BAICE), Co-Editor of *Teachers and Teaching: Theory and Practice*, Associate Editor of *International Journal of Educational Development*, a member of the Research Standing Committee of the World Council of Comparative Education Societies (WCCES), and a member of the Research Evidence and Impact Panel for the Leadership College for UK Government. Professor Gu has directed and codirected many government and research council funded projects in the areas of teacher professional development, school improvement, and systemic reform and change. She has led a £1.9 m UK Economic and Social Research Council (ESRC) funded project *Schools as Enabling Spaces to Improve Learning and Health-Related Quality of Life for Primary School Children in Rural Communities in South Africa*. Some of her books have been translated into Chinese, Japanese, and Spanish.

Professor Smith is a New Zealand Maori of Te Aitanga a Hauiti, Ngati Porou, Kati MamoeNgati Apa, Ngati Kahungunu descent. He is a highly regarded and internationally recognized, Maori educationalist and scholar. He has been at the forefront of transforming Maori and Indigenous social, economic and cultural conditions through re-developing education and schooling outcomes. His work links theoretical thinking and practical applications within an ongoing cycle of transforming praxis.

Professor Smith trained as a teacher at Auckland Teachers College and taught in Auckland schools. He also lectured in Education at the Auckland College of Education. He was one of the first teachers and developers of a Kura Kaupapa Maori, an alternative, Maori philosophy and principles-based School. These Maori immersion schools have grown from a single entity in 1988 to over seventy-five publicly funded schools in 2015. His theoretical leadership in the Education Department at the University of Auckland helped inform the emergence of Maori Education as a distinct field of study across the New Zealand Tertiary Sector. This work has encouraged a wide range of academic studies focused on overthrowing persisting inequities within and as a result of education and schooling in New Zealand. His significant contribution to New Zealand education is to be seen in his work related to Kaupapa Maori as a theory of Transformative Praxis. All of these elements derive from his PhD research entitled, "The Development of Kaupapa Maori: Theory and Praxis (1997)".

Professor Smith's later academic work centered on developing theoretically informed strategies related to transforming high and disproportionate levels of Maori cultural, political, social, educational, and economic marginalization. He has been a significant scholar involved in the emergence of Tribal "university" institutions (Wananga) and is the former foundation Chair of the Council for Te Whare Wananga O Awanuiarangi. He led the successful Treaty of Waitangi Claim and settlement for Awanuiarangi. In his former position as Pro Vice Chancellor (Maori) at the University of Auckland, he was responsible for developing significant structural change within the institution while working within the Office of the then Vice Chancellor, Dr. John Hood. Notable achievements included implementing a Maori development strategy within the University which required all Deans to be responsive in their performance results for Maori and Pacific advancement; the oversight of the Proposal and winning of a National Centre of Research Excellence (Nga Pae o te Maramatanga); the initiation of the Maori and Indigenous doctoral program aimed at creating 500 Maori PhD graduates across the country in five years; the recruitment of top Maori academic scholars into the University of Auckland; the development of Kaupapa Maori as a theory of transformative praxis and which has had national and international influence. Professor Smith also served on the University of Auckland Council for three years as the Professorial representative for Academic staff.

In 2007 Professor Smith accepted a role as the Universitas 21 Distinguished Visiting Professor in Indigenous Education hosted by the University of British Columbia (within the Faculty of Education). Although the position was initially intended for two years, the role was extended for a further three years. While situated at the University of British Columbia, Professor Smith also chaired the Educational Policy Studies Department for three years. These positions allowed engagement with many Canadian universities as well as other universities across the world.

Professor Smith has made significant contributions to the political, social, economic, and cultural advancement of Maori and indigenous communities in New Zealand and around the Pacific Rim. He has worked extensively with other Native/Indigenous/First Nation's peoples across the world, including in Canada, India, US mainland (including extensive work in Hawaii and Alaska), Norway, Taiwan, Chile, Australia, as well as with selected Micronesian and Pacific nations. He is a regular contributor to national and international forums and conferences. Professor Smith has been an authoritative voice within the critical debates on *social, cultural and economic inequality* both in New Zealand and abroad, and he maintains a strong influence in the Maori/Indigenous languages revitalization movements.

Professor Smith stepped down from the administrative position of CEO/Vice Chancellor at Te Whare Wananga o Awanuiarangi in 2015 after eight years in the role. He resumed his academic research and writing career. In 2019 he was invited to take up a special Chair – Te Toi Ihorei ki Purehuroa – A "distinguished Professorial position at large" established for him at Massey University.

Professor Smith has been recognized and honored for his international contributions, receiving an Honorary doctorate (D.Litt.) from the Okanagan University College in 2005, and an Honorary doctorate (LLD) from the University of Northern British Columbia in 2013; he was elected as a Fellow of the American Education Research Association in 2014, and was awarded a Queens Honour – a CNZM in 2014. He was given the Prime Minister's Life-time Achievement Award (2017); and received the Te Ururangi National Award for Education (Matariki Awards, 2019).

Professor Smith is married to Professor Linda Tuhiwai Smith and they have one daughter and two mokopuna (grandchildren).

Therese N. Hopfenbeck is Professor of Measurement Analytics in the Melbourne Graduate School of Education, The University of Melbourne. Before starting her position in Melbourne, she was Professor in Educational Assessment and Director of the Oxford University Centre for Educational Assessment. She is a Visiting Fellow at Kellogg College, University of Oxford, elected Vice-President of *The Association for Educational Assessment-Europe* and Lead Editor of the journal *Assessment in Education, Principle, Policy and Practice*. Dr. Hopfenbeck's research agenda focuses upon bridging research on self-regulation and classroom-based assessment and making sense of international large-scale studies in education. In collaboration with Professor Nancy Perry, University of British Columbia, she is currently leading an international network of researchers disseminating classroom-based research, funded by Social Sciences and Humanities Research Council of Canada (2020–2022). She is also currently Principal Investigator for two research projects funded by IB, on critical thinking in PYP schools internationally and evaluation of education reforms in Kent, UK (2020–2022). In 2020, she led the research on Critical Thinking in the Diploma Program in Australia, England, and Norway (<https://ibo.org/research/outcomes-research/diploma-studies/critical-thinking-skills-of-dp-students/>). Dr. Hopfenbeck was Principal Investigator for the PISA (2022) study in England, Northern Ireland, and Wales, in collaboration with Pearson UK (2018–2023). She was the Research Manager of PIRLS (2016), funded by The Department of Education, UK.gov, and Principal Investigator of a major ESRC-DFID research study, Assessment for Learning in Africa (ES/N010515/1) (2016–2019).

Since coming to Oxford in 2012, she has been the recipient of funding from ESRC-DFID, OECD, The Norwegian Research Council, Education Endowment Foundation, State Examinations Commissions Ireland, Jacob Foundation, and the International Baccalaureate totaling more than £2 mill in addition to a single grant of £4 mill in collaboration with SLATE: Centre for the Science of Learning & Technology at the University of Bergen, Norway. Prior to her appointment at Oxford, she worked as a postdoctoral researcher at the University of Oslo's research group for Measurement and Evaluation of Student Achievement at the Unit for Quantitative Analysis of Education (2010–2011). She is Adjunct Professor of the Norwegian University of Science and Technology (NTNU), member of the Visiting Panel for Research at the Educational Testing Service (ETS) in Princeton, expert member of the PISA (2022) Questionnaire Framework group, appointed by ETS and OECD (2014–2023). She has advised on the implementation of formative assessment programs in India, South Africa, Norway, and the Emirates and carried out policy work for UNESCO/OECD and the Norwegian Ministry of Education Norway. Therese has a presence on LinkedIn, ResearchGate, [Academia.edu](https://www.academia.edu/), and Twitter: @TNHopfenbeck.

Nataliya Ivankova, PhD, MPH, is Professor in the School of Health Professions at the University of Alabama at Birmingham (UAB). As an applied research methodologist working at the intersection of mixed methods, qualitative, community-based, action, and translational research, she is internationally recognized for her empirical and methodological publications. She shares her research expertise through teaching mixed methods and qualitative research courses, conducting workshops and guest lectures, mentoring doctoral students and junior faculty, and serving as key personnel on funded research projects. At UAB, she directs an online graduate certificate program in *Applications of Mixed Methods Research* and oversees the design and analytical aspects of qualitative and mixed methods studies through the Center for Health Informatics for Patient Safety and Quality. She is a founding Coeditor of the *Mixed Methods Research Series* (Sage) and serves as an Associate Editor for the *Journal of Mixed Methods Research*.

Professor Jahnke is Director of Toi Kura Centre for Maori & Indigenous Education. She was the 2019 inaugural Toi o Te Wananga Fellow. Professor Jahnke holds professional qualifications in education and is cofounder and immediate past Chair of the Indigenous Peoples of the Pacific Special Interest Group of the American Education Research Association (AERA). She currently serves on the AERA Executive Committee. She was a member of the Social & Human Sciences Sub Commission of the NZ National Commission for UNESCO, the NZ Bioethics Council, the NZ Ethics Committee on Assisted Reproduction Technology, and Chair of NZ Health Research Council Ethics Committee. She is currently Cochair of the Aotearoa Research Ethics Board and a Fulbright Scholar.

Berit Karseth, PhD, is Professor at the University of Oslo, Department of Education. Karseth's main research and publications lie in the field of education policy, reforms, and curriculum studies. She has edited four books and written several journal articles and book chapters in both Norwegian and English. Her most recent publications in English include articles published in the *Journal of Education Policy*, *Scandinavian Journal of Educational Research*, *Journal of Curriculum Studies*, and *European Educational Research Journal*. Karseth was the elected dean of the Faculty of Educational Sciences at the University of Oslo 2013–2016 and is currently in the leadership team of the research group Curriculum studies, educational leadership, and governance (CLEG) at the same institution.

Dr. Kenneth Leithwood is Emeritus Professor at OISE/University of Toronto and an honorary professor at the University College London and the University of Nottingham. His research and writing is about school leadership, educational policy, and organizational change. He has published extensively on these topics. For example, his most recent books include *Leadership Development on a Large Scale: Lessons for Long-term Success* (2018, Corwin), *How School Leaders Contribute to Student Success* (2017, Springer), and *Linking Leadership to Student Learning* (2012, Jossey Bass). Professor Leithwood is the inaugural recipient of the University of Toronto's *Impact on Public Policy* award, AERA (2011) *Outstanding Leadership Researcher Award*, the 2012 *Roald F. Campbell Lifetime Achievement Award* from the University Council for Educational Administration, and the Ontario Principals' Council *Outstanding Educator of the Year* award for 2017. He is a *Fellow of the Royal Society of Canada*. A recently published bibliometric analysis found that Dr. Leithwood was the most frequently cited, highest impact educational leadership researcher in the world.¹ Research.com's 2022 Ranking of the Top 1000 Scientists in the area of Social Sciences and Humanities ranked Dr. Leithwood 70th in the world and 7th in Canada.

Xiufeng Liu is a Professor of Science Education at State University of New York, Buffalo, and a Fellow of the American Association for the Advancement of Science (AAAS). He obtained his PhD from the University of British Columbia in 1993. Before his current position, he taught high school chemistry in China, and was a tenured faculty member at St. Francis Xavier University and University of Prince Edward Island, both in Canada. From September 2020 to August 2022, he served as a program director in the Division of Research on Learning of the National Science Foundation. Dr. Liu conducts research on measurement and evaluation of STEM education and student learning of cross-cutting concepts of matter and energy. Dr. Liu is currently a Coeditor-in-chief for the journal *Disciplinary and International Science Education Research* (Springer) and an Associate Editor for the *Journal of Research in Science Teaching*, a premier journal in science education.

Margie Maaka is a Professor of Education at the University of Hawai'i at Mānoa. Her PhD is in educational psychology. She also holds professional qualifications in education from the University of Waikato and Hamilton Teachers College. She is cofounder and current Program Chair of the Indigenous Peoples of the Pacific Special Interest Group (SIG) of the American Educational Research Association (AERA). From 2017 to 2020, she served as a member of the AERA Executive Council and Chair of the SIG Executive Committee. Before that (2014–2017), Professor Maaka served as a member of the SIG Executive Committee. She has also served as a member of the Ngā Pae o te Māramatanga Center of Research Excellence International Research Advisory Panel. Her research on community-based educational renewal saw her recognized as a national scholar with the Goodlad Institute for Educational Renewal. As Cochair of the Sovereign Councils of the Hawaiian Homelands Assembly's Committee on Education, she prepared educators and educational leaders for public schools in the Hawaiian Home Lands Trust communities. Currently, Professor Maaka is committed to the preparation of indigenous educational leaders in higher education. Her research interests include community partnerships, educational psychology/indigenous educational psychology, indigenous development and advancement, educational policy, multiliteracies, and language and cognitive development.

Diane Mayer is Professor Emerita at the University of Oxford. Her research and scholarship focus on teacher education and early career teaching, examining issues associated with the policy and practice of teachers' work and teacher education.

Daniel McCaffrey is the Associate Vice President of Psychometric Analysis and Research in the Research and Measurement Science unit of the Research and Development division at ETS. Dan's research interests include the evaluation of artificial intelligence scoring of constructed responses, developing tools and methods for causal modeling, evaluating the psychometric properties of student achievement growth measures derived from annual test scores, and methods to account for measurement error in secondary data analysis. Dan received his PhD in Statistics from North Carolina State University in 1991.

Judy Parr is Professor Emerita at the University of Auckland, Faculty of Education, where she was the founding Head of the School of Curriculum and Pedagogy. A psychologist, Dr. Parr's research program is located broadly within improvement science. Her expertise is in literacy, specifically writing and its development, encompassing instructional issues like teacher knowledge and practice and the assessment of writing. Much research has been collaborative, with colleagues and practitioners within major national projects for school improvement aimed at raising achievement in literacy and, internationally, as part of funded large-scale research projects, for example in Canada and Norway. Dr. Parr has published widely in the areas of literacy, assessment, and professional learning.

Jeong-eun Rhee is a Professor of Education, Long Island University, Post, New York. Born and raised in Seoul, Korea, she earned her bachelor's degree in Educational Psychology from Ewha Women's University. In 1992, she came to the US as an international student and received an MA in Educational Psychology from West Virginia University and a PhD in Educational Policy and Leadership from the Ohio State University. As an interdisciplinary cultural researcher and educator, her recent work focuses on developing and supporting transnational, intergenerational, and decolonial feminist knowledge projects in/through antioppressive education. She recently published *Decolonial Feminist Research: Haunting, Rememory, and Mothers*, which received an honorable mention for the 2022 Qualitative Book Award of International Congress of Qualitative Inquiry.

Fazal Rizvi is an Emeritus Professor of Global Studies in Education at the University of Melbourne, as well as at the University of Illinois at Urbana-Champaign. He is also a Visiting Professor at the Universities of Turku in Finland and Pretoria in South Africa. He has written extensively on issues of identity and culture in transnational contexts, globalization and education policy, and Australia-Asia relations. He has published widely and his book, coauthored with Bob Lingard, *Globalizing Education Policy* (Routledge, 2010), is used widely in courses around the world. A sequel to this book, *Reimagining Globalization and Education* (Routledge, 2022), has been published recently. Fazal is currently researching educational reform in Bhutan. He is a Fellow of the Australian Academy of the Social Sciences, a past Editor of the journal, *Discourse: Studies in Cultural Politics of Education*, and a past President of the Australian Association of Research in Education.

Theresa Rogers is Professor of Language and Literacy Education at the University of British Columbia. Her research interests include youth arts, media and critical literacies, adolescent literature, and teacher education in literacy. Most recently she published "Youth Activism through Critical Arts, Transmedia, and Multiliteracies" in the *Oxford Research Encyclopedia*. She is author of the book, *Youth, Critical Literacies and Civic Engagement: Arts, Media and Literacy in the lives of adolescents* (Routledge) and numerous articles in scholarly journals such as *Literacy Research: Theory, Method and Practice*, *Reading Research Quarterly*, *Pedagogies*, *Language Arts*, *Children's Literature in Education* and *Journal of Literacy Research*. See: <https://ubc.academia.edu/TheresaRogers>.

Professor Chika Sehoole is a Professor of Higher Education and the Dean of the Faculty of Education at the University of Pretoria. He obtained his PhD at the University of the Witwatersrand, Johannesburg, in December 2002. In 2003/4 he was a visiting Rockefeller postdoctoral fellow at the Centre for African Studies at the University of Illinois in Urbana Champaign. In 2005/06 he was a New Century Fulbright Fellow, again, at the same university. His research interests are in the areas of higher education policy, internationalization of higher education, higher education in Africa, and teacher education. He has served in several international research projects focusing on higher education and providing expertise from the South African and African perspectives. In 2013–2017 he served as the Chairperson of the Board of the African Network for Internationalisation of Education (ANIE). He currently serves as the chairperson of the Education Deans' Forum of South Africa. He has published a singled authored book titled "Democratising higher education policy, constraints of reform in post-apartheid South Africa" by (Routledge); three edited scholarly books on higher education and more than 40 articles in journal articles, book chapters, and popular media.

Roland Sintos Coloma is a tenured Full Professor of Teacher Education at Wayne State University in Detroit, Michigan. A scholar of history, cultural studies, and education, his research addresses critical questions of race, gender, and sexuality from transnational and intersectional perspectives. His publications include *Asian Canadian Studies Reader* (2017), *Filipinos in Canada: Disturbing Invisibility* (2012), and *Postcolonial Challenges in Education* (2009). His articles have been published in top-ranked peer-reviewed journals, including *Curriculum Inquiry*, *Discourse: Studies in the Cultural Politics of Education*, *Educational Studies*, *Educational Theory*, *History of Education Quarterly*, *International Journal of Qualitative Studies in Education*, *Paedagogica Historica*, and *Race Ethnicity and Education*. He has successfully garnered over \$2 million of external funding from federal, education, and nonprofit agencies, including the US Department of Education, National Education Association, Spencer Foundation, and Schultz Family Foundation as part of the Bill & Melinda Gates Foundation's Grand Economic Challenges. Roland has served in various university leadership roles as an assistant dean, department chair, graduate coordinator, and center codirector. He was president of the American Educational Studies Association (2018–19), editor of the *Educational Studies* journal (2014–17), and program cochair of Division G (Social Context of Education) in the American Educational Research Association (AERA). He received the 2017 Distinguished Scholar Award from the AERA Research on the Education of Asian Pacific Americans SIG and the 2015 Article of the Year Award from the AERA Queer Studies and Education SIG. In 2020, he was appointed to the Governor of Michigan's statewide Asian Pacific American Affairs Commission. Born in the Philippines and raised in California, he completed his PhD in Cultural Studies in Education and Minor in African American and African Studies from The Ohio State University in 2004.

Roger Slee is the Founding Editor of *The International Journal of Inclusive Education* and *The Journal of Disability Studies in Education*. A former Deputy Director-General of Education in Queensland, Australia, he has advised governments on inclusive education policy and practice. His published books include: *The Irregular School*; *Inclusive Education Isn't Dead, It Just Smells Funny*; and *Ethics and Inclusive Education: Disability, Schooling & Justice* (with Gordon Tait). Roger was commissioned by the UNESCO to write the scoping paper for the 2020 Global Education Monitoring Report, *Inclusion and Education*. Roger also held the Chair of Inclusive Education at the Institute of Education, London, and is now the Diamond Jubilee Professor of Disability & Inclusion in the School of Sociology & Social Policy at the University of Leeds.

Ninni Wahlström is a Professor of Education at Linnæus University, Sweden. Her current research focuses on transnational and national policy discourses and their implications for national curriculum and classroom teaching from a perspective of curriculum theory and educational philosophy. Most recent publications are "School and democratic hope: the school as a space for civic literacy" in *European Educational Research Journal* (2022) and Wahlström (Ed.) *Equity, Teaching Practice and the Curriculum*, Routledge (2022).

Lei Wang is Professor and PHD advisor of the Institute of Chemical Education, the College of Chemistry in Beijing Normal University (BNU). She is also the member of Teaching Steering Committee on Basic Education of Ministry of Education of China and the director of its branch Committee on Secondary Chemistry Education, the director assistant of Faculty of Education of BNU, vice director of the Institute of Science Education of BNU, and Chairman of the Chemistry Education Committee of the Chinese Chemical Society. She is one of the chief experts in developing the *Secondary School Chemistry Curriculum Standards* of MOE. She works as the chief editor of high school chemistry textbooks (Shandong Science and Technology Press, 2004 and 2019 editions) and junior high school chemistry project-based learning textbooks (Shanxi Education Press, 2018 edition). She achieved the first prize of the National Basic Education Teaching Achievement Award, the second prize of the National Higher Education Teaching Achievement Award, and the BAOGANG Education Outstanding Teacher Award.

Everard Weber is a retired professor. He has worked in the field of education for more than 40 years. Currently he is a research associate at the University of Johannesburg (UJ) and an academic advisor in the Future Professors Programme (FPP) at UJ. He studied African Languages and History at the University of Cape Town and Comparative and International Education at Harvard University. In South Africa he has worked at Crestway High School in Cape Town, the University of the Witwatersrand, and the University of Pretoria. A recent book is *A home away from home: a community of international and South African university students*. The FPP is a government-sponsored initiative that seeks to develop the next generation of professors and academic leaders in all disciplines, across all universities in South Africa. He is in addition presently conducting fieldwork on curriculum change in South African higher education with Professor Shireen Motala and Dr. Venise Joubert at UJ. This project is grounded in the history of southern Africa and hopes to contribute to the scholarship of postcolonialism.

Ian A.G. Wilkinson is Professor in the Department of Teaching and Learning at The Ohio State University and Honorary Professor in the School of Curriculum and Pedagogy at the University of Auckland, Aotearoa/New Zealand. He has a background in educational psychology with special interests in cognition, instruction, and research methodology as they relate to the study of literacy. He served as coauthor of the influential report, *Becoming a Nation of Readers* (National Academy of Education, 1985). He was Co-Editor of *Reading Research Quarterly* from 2006 to 2012 and was inducted into the Reading Hall of Fame in 2021. His research examines the impact of classroom discussion and dialogue on students' reading comprehension and argument literacy and the implications for professional development of teachers. Recently he coauthored books include *The Most Reasonable Answer: Helping Students Build Better Arguments Together* and *Quality Talk About Text: Discussion Practices for Talking and Thinking About Text*.

David B. Yaden, Jr., PhD, is the *Jewell M. Lewis Endowed Distinguished Professor of Literacy* in the Department of Teaching, Learning and Sociocultural Studies at the University of Arizona. Prior to his present position at the University of Arizona, he held appointments at Emory University, the University of Houston, and the University of Southern California. He served as Co-Editor of the *Journal of Literacy Research*, one of the premier research journals in the field of literacy studies, and was a Principal Investigator in the federally funded Center for the Improvement of Early Reading Achievement (CIERA) where he implemented an early literacy curriculum for linguistically diverse preschoolers in inner-city Los Angeles. He also directed a statewide consortium of researchers from Arizona's major universities in the evaluation of the state's early childhood initiative to evaluate health, developmental, and educational factors contributing to school readiness. His research interests and specializations include developmental issues in early childhood education, the acquisition of literacy and biliteracy in young emergent bilingual children, family literacy, theories of reading disability, microgenetic research design, and the application of complex adaptive systems theory to growth in reading and writing.

Volume 10: Literacies and Languages Education

David Yaden and Theresa Rogers

© 2023 Elsevier Ltd. All rights reserved.

Introduction

The study of literacy is not only an educational matter, but a broadly shared field in which multiple disciplines have laid legitimate claims to the functions and/or consequences of reading and writing beyond any pedagogical aspects. For example, historians Patricia Limerick (1987) and Richard Slotkin (1973) have provided vivid and graphic accounts of how the pamphlets, flyers, and popular literacy of the early American West played key roles in what Worster et al. (1989) have termed the “lingering injustice that a conquering people did, and are still doing, to the resident native peoples and ethnic minorities” (p. 305). And in a similar vein, Edward Said (1979, 1994), literary theorist and cultural critic, makes a compelling case that such literary and musical masterpieces of the 19th century as Joseph Conrad’s (1899) *Heart of Darkness*, Jane Austen’s *Mansfield Park* (1814), and Giuseppe Verdi’s opera *Aida* (1871) were key cultural supports to the promotion of racism and the colonizing interests of Belgium, Britain, and France.

In addition, scholars in disciplines such as the Classics have also added illuminating insights into the structure of Homer’s *Iliad* and *Odyssey* (Havelock, 1963, 1988; Ong, 1982; Mitchell, 2011) as a production of oral poetry, not written, discovering as well the complex, oral narrations of early 20th-century poets in Eastern Europe as well as storytellers in most traditional societies including the songs of slaves and rural preachers in the American south (Kanigel, 2021; Lord, 1960/2000; Parry, 1987). Such is the primacy of oral poetic traditions that Alfred Lord, heir to Milman Parry’s legacy, makes the following observation:

We realize that what is called oral tradition is as intricate and meaningful an art form as its derivative “literary tradition.” In the extended sense of the word, oral tradition is as “literary” as literary tradition. It is not simply a less polished, more haphazard, or cruder second cousin twice removed, to literature. By the time, the written techniques come onto the stage, the art forms have been long set and are already highly developed and ancient.

Lord (1960/2000, p. 141)

There is also the perennial debate on the origins of written systems, whether they emerged from the indexing of commercial exchanges of goods and services or from the processes of communication (Daniels, 2017; Robinson, 2007; Sampson, 2015). Emanating initially within the field of sociology, there has also been an extensive and ongoing debate particularly since the publication of Goody’s and Watt’s (1963) seminal piece, “The consequences of literacy,” on whether populations with alphabets, in particular, have a different way of thinking, a more analytic rationality, about the world than those with other scripts or people who have not learned to read (Goody, 1996; Olson, 1996, 2016; Ong, 1982) in any written language. And in his classic *Tristes Tropiques*, anthropologist Levi-Strauss (1955) made the grim claim from his observation of the reaction to written language by members of traditional societies that writing “seems to have favoured the exploitation of human beings rather than their enlightenment,” and, finally, that “my hypothesis, if correct, would oblige us to recognize the fact that the primary function of written communication is to facilitate slavery (p. 299)” as tribal chieftains understood that by mimicking facility with such a tool came additional authority and power.

Goals of the Literacies and Languages Education Volume

Suffice it to say, that any compilation of literacy and languages research such as the present volume contains must necessarily be delimited, although we found the creation of our own arbitrary, liminal boundaries extremely difficult to impose. Thus, it bears noting how the chapters were assembled for the Literacies and Languages education volume. We first took to heart the Vision and Goal statements by the Editors-in-Chief (EIC) that this 4th edition of the *International Encyclopedia of Education* would reflect “a deeper critical engagement with issues of globalization, internationalization and cross-cultural matters.” Therefore, we attempted to address this charge by (a) specifically searching for literacy and languages investigations which touched on one or more of these three themes (i.e., globalization, internationalization and cross-cultural matters); (b) requesting that authors, both in the initial invitation and in review comments, include citations and additional elaborations of literacy research outside the country in which they conducted the majority of their own research; and (c) by identifying authors, particularly in the Global South, who were addressing various issues in learning to write and read in languages other than English. While this latter tack wasn’t as successful as we would have liked, we are encouraged to have several scholars from Mexico, Central and South America, Africa, the Middle East, and China who submitted chapters. Overall, we feel that nearly every chapter, even those reporting on English-language studies, extends and connects the literacy research discussed with other related investigations across the globe.

Another goal of the EIC team for the volume was to encompass a broad range of studies, including both past topics represented in the 3rd edition as well as new and emerging areas of research over the last decade in particular. In the prior third edition (Peterson et al., 2010), studies in reading and writing were integrated under the topic of “Curriculum Development,” and constituted approximately 30 chapters addressing such topics as adult literacy, early language and literacy acquisition, bilingualism, second- and

foreign language learning, reading and technology, literacy issues among exceptional populations, reading and writing assessment in schools, neuroscience and reading, and writing.

In the present volume, the 94 chapters not only expand and update research on these familiar topics, but extend the range of literacy studies across many other areas, including studies in the digital and multimodal aspects of reading and writing, artificial intelligence, critical literacies, race, gender and sexuality, cosmopolitan and international literacies, Indigenous literacies, World Englishes, children's literature development in several Global North and South countries, and several theoretical perspectives on literacy, including posthumanist, sociocultural, developmental, humanities-oriented, and some general epistemological aspects which underlie theorizing in reading and writing. Thus, in this 4th edition of the *Encyclopedia* there is a much wider scope of literacy studies represented, which is no surprise. But even so, as mentioned earlier, the full range of disciplines which lay claim to literacy studies in some aspect cannot practically be taken into consideration.

A final goal which we attempted to address in soliciting authors for the volume was that the chapters were to be critically oriented, forward-looking, dynamic, and serving as a "springboard for advances dealing with new formations, new arguments, new theories and offering future directions." Since the *Encyclopedia's* readership is broadly interdisciplinary, international, and inclusive of both emerging and established scholars, all authors were encouraged to not only describe the developments in their subfield of literacy study, but to hypothesize, speculate, and prognosticate about what future developments are needed for the field to thrive and offer creative solutions to problems or issues not easily resolved. Specifically, in the review process, authors were asked to unpack and elaborate on statements simply indicating that more research needed to be done. They were asked to identify promising programs or approaches as exemplars, and to offer a critical appraisal of why progress may or may not be happening currently, and what needed to be done to overcome these challenges. As volume editors, we are hopeful that this volume represents indeed "a springboard" toward literacy research which is more equitable, inclusive, and an accurate, credible representation of the populations from which information is obtained such that the outcome of such research truly enhances the well-being of the world's peoples.

We need to mention as well that the COVID-19 pandemic, raging within these last nearly three years, had a significant impact on authors' ability to accept an invitation to write an entry, and, therefore, some topics had to be dropped due to the many challenges to personal and professional lives that forced some authors to withdraw even after the writing had begun. These extenuating circumstances often resulted in multiple declinations by respected authors known for their expertise in those areas, some of which included linguistic landscapes, trans*+ centered literacy study, the reading of augmented texts, writing practices among global majority youth, 3rd space approaches to literacy research, subaltern literacies, resistance writing, and public-facing literacy scholarship, just to name a few. And, sadly, during the past two years of this volume's development, three prominent literacy researchers passed—Vivian Yenika-Agbaw, a scholar of African children's literature, Barbara Guzzetti, a widely-known expert in literacy and gender studies, and David O'Brien, a prominent researcher in the field of disciplinary literacies. We are thankful, however, for the coauthors on those manuscripts who completed the submissions as a testament to their colleagues and mentors so that their voices would be represented in the *Encyclopedia*.

Themes and Methodological Trends

The fact that we noted some trends in research which can be recognized in the *Literacies and Languages Education* volume does not mean that there are any universal, or "grand narratives," as it were, to be told. If anything, within each "theme" or strand of connected conceptual ideas, methodological approaches, or theoretical positions, there are contradictions and disjunctions that are apparent as well.

For example, for the most part, what can be detected in the chapters across the labels of the major sections is what Frederick Erickson (2018) has called a "critical realist" approach to the ontology and epistemology (p. 58) of literacy research. Erickson goes on to suggest that this approach is akin to what Bent Flyvbjerg (2001) has termed, drawing from Aristotle, *phronesis*:

Phronesis goes beyond both analytical, scientific knowledge (*episteme*) and technical knowledge or know-how (*techne*) and involves judgments and decisions made in the manner of a virtuoso social and political actor. I will argue that *phronesis* is commonly involved in social practice, and that therefore attempts to reduce social science and theory either to *episteme* or *techne* or to comprehend them in those terms, are misguided (p. 2).

Thus, the *Encyclopedia's* readers will find across a great number of the chapters an emphasis on action-oriented language and literacy knowledge that is highly local, situated, creative, dynamic, and spatialized according to the particular cultural norms, individual experiences, and contextual settings of the research population. There are few, if any, calls for a "one-size-fits-all" approach to literacy learning.

On the other hand, within this research emphasis to gain a deeply individual and contextualized knowledge of the influences upon literacy growth, there is also a nuanced emphasis on "collectivity"—in other words, that literacy acquisition, development, and teaching is an enterprise that calls for the cooperation and networking of numerous persons as actors in any literacy environment. Unlike a general positivist approach that attempts to tease out causes within what Cronbach and Meehl (1955) termed as a "nomological network," the critical realist orientation links all the actors in the network together and attempts to understand the proportionate contributions of each, each playing pivotal roles at various times. Like Flyvbjerg's virtuoso social actor, all participants or collaborators in a research study are conducting their own virtuoso performances simultaneously, and the greater burden

on the researcher is to understand how all these performances—including their own—are inextricably connected to produce the conditions in which the literacy event, act or phenomenon is being observed or investigated. Thus, overall, the chapters in this volume generally adhere to Vygotsky's (1931/1997) notion that "To study something historically means to study it in motion ... for only in movement does a body exhibit what it is." Static causes, then, will seldom be identified.

This orientation to literacy research largely explains why the majority of the chapters report on research that is qualitative or "interpretive" in nature (Erickson, 2018). However, this situation is not because invitations were not extended to researchers adopting experimental and quantitative approaches, because they were, but were declined for various reasons. It is not the case either that we specified to invited authors that there were certain kinds of methodologies that would be preferred. Each author had full autonomy related to the research they would report in their areas of expertise. While we would have liked better representation from quantitatively-oriented investigators, we suspect that this didn't happen because within the last decade the literacy field in particular has been substantively influenced by the overall trends in social science inquiry toward poststructural, posthumanist, participatory, critical, and nonrepresentational theoretical research frameworks (Lincoln et al., 2018; Unrau et al., 2019). Indeed, the term "bricoleur," derived from Levi-Strauss' (1966) description of the construction of mythical thought in traditional societies, and reintroduced into modern research parlance as a person who is simultaneously "scientist, naturalist, fieldworker, journalist, social critic, artist, performer, jazz musician, filmmaker, quilt maker, and essayist" (Denzin and Lincoln, 2018, p. 11), is a persona which has been taken on by many present-day literacy researchers, a fair number of whom are represented in this volume.

Section Overviews

We have divided the chapters of the volume into seven major sections, although we candidly acknowledge that these sections, as well as their labels, have fuzzy edges, and the research represented by the chapters so designated could have been categorized potentially in any number of ways. The chapters in the volume under each section heading are not so much organized by title or even subtopic, but more by common motifs or loosely woven themes which occur repeatedly across most of the entries in the section. That said, brief summaries of each major section are offered below.

Acquiring, Developing, Learning Languages/Languaging, and Literacy

The first section includes research that focuses essentially upon the processes and diverse contextual situations of language and literacy acquisition and subsequent development whether it relates to very young children's first encounters with their heritage languages and written forms or older learners' in and out of school experiences with first, second, or foreign languages. Across all entries in this section are three notions. First, that language learning is, in the words of one author, always "dynamic, complex, polyphonic, and shifting across time and space." Whether it is in the acquisition of a foreign language, a second language, or negotiating languages and literacies across borders, all language users, beginning, developing, or experienced, operate indeed like "virtuosos," orchestrating their language and literacy resources in response to linguistic settings which are, in turn, fluctuating themselves.

Another key aspect of the chapters in this section is the emphasis the "criticality" of language users, both in everyday usage and learning situations. Every encountered literacy or language event or act requires judgments and decision-making given the situational parameters and power dynamics. In other words, as Goffman (1967) has described, language users are continually involved in "face-work," acting out a *line*—"that is, a pattern of verbal and nonverbal acts by which he expresses his view of the situation, and through this his evaluation of the participants, especially himself" (p. 5). Finally, it becomes paramount, then, as is also addressed in this section, that any assessment or assessor(s) of language or literacy use must be cognizant of the multiple dimensions of performance embedded in any linguistic event, so that judgments of that performance may be accurate, credible, and reflective of the language and literacy strengths of the users.

Cultural, Critical, and Community Literacies

Some of the key themes which run through the 15 chapters in this section include (a) the systemic and institutional oppression, racism and educational barriers that are encountered by particularly Black, Indigenous, and other People Of Color (BIPOC), members of the LGBTQIA+ community, and persons in exceptional populations both in and out of school settings; (b) that learning is far beyond just a cognitive function, but is deeply embedded in the racial, cultural, historical, socioeconomic, and gendered identities of language and literacy users; (c) an emphasis upon the asset-based, multimodal linguistic resources of family and community from which all learners draw; and (d) the ongoing quest for learners and educators alike to develop a critical consciousness and action-oriented behaviors for achieving social justice, inclusion and equity in school classrooms and the broader society.

Touching on topics such as border and family literacies, gender and literacy, federal and state language, and literacy policies, the multimodality of literacy learning across various in and out of school settings, these papers stress simultaneously both the historical oppression of marginalized populations, while at the same time pointing out the notable resistance to these structural and societal barriers through access to personal, family, and community resources as well as the extensive linguistic resources derived from biliteracy and multilingual abilities. It is also abundantly clear from these articles that our current educational systems, both curricular and evaluative, are woefully unequipped at the present time to accommodate the richness of what young learners, youth, and their

families possess, squeezing them into traditional educational molds and ideologies which strip away linguistic and personal resources which otherwise could be used for the benefit of all. The chapters challenge readers to adopt a liberatory, and transformative attitude to achieve more equitable systems.

Literacy Development and Pedagogy Among Children, Youth, and Adults.

This section encompasses a range of theoretical frames that provide multiple perspectives on language and literacy development and pedagogy among children, youth, and adults. These frames include cognitive, linguistic, sociocognitive, constructivist, sociocultural, creative, and critical perspectives, with several drawing from multiple frameworks. A throughline in many of the pieces is an epistemology of language and literacy practices as contextualized in the social, cultural, and material conditions of their uses, and the role of language and literacy in addressing and responding to the lived experiences and challenges of our contemporary highly connected and global world. These language and literacy practices include engaging with a range of texts meaningfully, imaginatively, collectively, and critically.

Attention to learning differently is another hallmark of this section. While we all learn, in some measure, in different ways, here the needs of exceptional learners who struggle with literacy development, have learning challenges, are autistic, or who read braille are considered, as is the importance of fostering social connectedness and a sense of competence. Overall, many of these authors advocate for shifting away from notions of language and literacy as decontextualized or from standardizing practices toward providing rich, contextual and creative approaches to pedagogy—what Edmiston (this volume) calls a more humanizing and transformative approach to teaching, learning, and evaluating in the schooling process.

Digital and Multimodal Literacies

Language and literacy are inherently multimodal practices—whether we are gesturing as we speak or using a pen to write; however, in the past several decades scholars have been paying increasing attention to the role and range of multimodalities in language and literacy practices. At the same time, educators have championed the value of integrating various modes in literacy teaching and learning pedagogies. This is largely due to the advent of connected digital technologies that have extended the access to and affordances of multimodal texts and practices. Several of these chapters speak broadly to theories, scholarship and practices of multimodal and digital language and literacy practices such as (a) theorizing a sensory literacies approach that emphasizes the vital roles of the senses, the body, and real-world referents across digital and non-digital practices; (b) defining the contours of a trans-literacy framework to understand how digital media is at the center of identity formation; (c) enlisting notions of social semiotics and transmediation to help unpack social and cultural meanings across modalities, and (d) conceptualizing digital literacies as “electracy”—as technologies intertwined with cultural and institutional formation and collective identities of a society in transition.

Many of these chapters then extend these conceptualizations of digital multimodal tools to explore what they offer in terms of the modes, spaces and reach of language and literacy practices, as well as the ways this rich variety of forms foster the complexity of meaning-making and entail play, creativity, criticality, and participatory practices. Specific topics range from reading with e-books, AI machine learning, and reading online to the many ways media and digital tools enhance engagement among reluctant readers, extend writing practices, support the production of creative and critical media texts, and engender global literacies and curricula.

Children’s Literature: An International Perspective

Children’s literature in all its forms remains a vital aspect of the literacies and literacy education of children and young adults. While various forms of storytelling are as old as cultures, children’s and young adult literature comprises a relatively new classification of literary works, having developed with the advent of the conception of childhood itself as distinct from adulthood, and has proven to be truly robust both in its traditional forms and highly adaptable to current technologies. The chapters here focus on contemporary critical perspectives of literature for young people, valuing it as a rich medium for critically reimagining lives and worlds. The authors speak to the compendium of new forms of literature that range from the metafictional to the digital, and carefully delineate the global world of children’s and young adult literature while considering the particular traditions across countries in Latin America, Asia, Southern Europe, the Middle East, and Africa.

As Peter Hunt (1999) has noted, “children’s books are part of the ideological structures and cultures of the world” (p. 4) and indeed these chapters illuminate how access, forms and topics of children’s and young adult literature, as well as the critical theoretical lenses that are taken up in related scholarly work, are deeply entwined with historical and political developments such as colonialism, shifting political philosophies and revolutions, and language policies and practices. A glimpse into the literature for young people across the globe reminds us of the variety and unique traditions, richness and purposes of this work that are too often overshadowed by the Western canon.

Literacies in the Global North and South

While local politics, language policies, traditional educational structures have a substantive impact within any one school, neighborhood or community—which is complicated enough to figure out, the entries in this section elevate some of these same forces of influence to a global scale with frighteningly global consequences. Inescapable in majority of the articles are trenchant

discussions of the historical and negative influences of colonialism as well as how ongoing imperialistic tendencies are still pervasive in many spheres, including inequitable access to educational resources, the imposition of official languages as the language of instruction in local areas, and the underresourced infrastructure of technological advances in many communities. It is made clear in these entries that the languages and literate practices of Indigenous people in every country are the most vulnerable to extinction, being threatened with ongoing oppression and even the intent of erasure.

Thus, there is a uniform clarion call yet again (see Brandt, 1980) in these chapters for all countries in the Global North and South to embrace a humanizing pluralism to dismantle colonial thinking and structures and to recognize the intellectual strengths and linguistic resources of the world's Indigenous peoples, not only as local solutions, but as a strategy for improving the well-being of all populations. These efforts include facilitating language recovery and restoration, eliminating economic insecurities, valorizing endogenous languages to deliver educational content, and working to eliminate conditions which exacerbate violence and injury.

Another pervasive theme recognized in nearly every chapter in this section is the historical and unwavering resistance to dominance, the reservoirs of deep spiritual strengths, the adaptive ability of Indigenous communities to maintain their own solidarity, and the will to create meaningful “third-space” literacy learning, thus, unrelentingly advocating for themselves and demanding that their voices play a role in solutions toward educational equity and improvement.

Contemporary and Emerging Theoretical and Methodological Issues in Literacy Research

The chapters in this final section embrace a range of theoretical and methodological perspectives from psycho-sociolinguistic, neurolinguistic, and developmental to broader epistemological issues, theories of embodiment, experimental humanities as well as postqualitative, postmodern, and poststructural inquiry. It is fair to say, however, that even models with roots in older psycho- or sociolinguistic theories emanating from fields such as psychology, anthropology and sociology now incorporate more dynamical features, drawing from findings in the neuro- and developmental sciences and evolutionary biology. These theories all stress the organicity of literacy growth as a species-specific, holistic, and intersectional adaption to ever-shifting, complex environmental influences.

Another group of authors in this section explore some of the epistemological shifts in literacy research that bend away from reductionism and the expert, omniscient observer such as existed in the “Golden Age” of anthropology (see Erickson, 2018) to incorporate the interleaving of researcher, the researched, the literacy space, and the dynamic social fabric within which any literacy event or act takes place. These chapters highlight the essential tension, as it were, between deriving an “explanation” from a study's findings to accepting some tolerable ambiguity as is characteristic of much social science research.

A final set of entries in this section place literacy research fully within the framework of a postqualitative or posthumanist theoretical frame. In this perspective, there are no definable “edges,” to literacy phenomena since they occur as an intersectional function of the individual, the community, the social milieu, the real or imagined spaces and materials within any setting—a “rhizomatic” structure for some. In this view, the study of “literacy” is almost a misnomer since any act of communication takes place within the full sensorium of the human experience as it is situationally spatialized. Researchers with this perspective do not so much “study” literacy as participate in its very construction with others.

Conclusion

The nearly 100 chapters in this volume are a fair sampling, we believe, of the research into various literacies and their related language foundations since the publication of the third edition of the *International Encyclopedia of Education* (Peterson et al., 2010). It is also the case that the entries in this new fourth edition provides a greatly increased range and scope of literacy studies, not only updating and enriching some long-researched areas of interest (e.g., children's literature, comprehension, vocabulary, spelling, bilingualism, second-language learning, family literacy), but broadening the field of language and literacy investigations to encompass very 21st century concerns in education such as the exploration of gendered literacy identities across all literacy environments, the spacialized and sociocultural impacts on learning, the injustices of inequitable language and literacy resources worldwide for marginalized populations, and the institutional and structured racism of language and literacy policies, both domestic and international, which continue to erect barriers preventing many Indigenous populations and members of the global majority from obtaining educational benefits. It must also be said, however, that the volume does not fail to highlight the deep intellectual resources and “thrivance” of Indigenous and oppressed peoples in every country, and the peril involved in ignoring their voices.

Finally, as editors of the Literacies and Languages Education volume, we have had the immense privilege of interacting with and reading the work of an international cadre of collegial and seminal scholars, immersing ourselves in their highly stimulating, thoughtful, and compelling research which has, in turn, enriched our own learning and work. We trust that the readership of this volume will profit from this remarkable compendium of chapters as we have.

LEARNING LANGUAGES/LANGUAGING AND LITERACY

Language development in the early years <i>Eve V Clark</i>	1
Dynamic system approaches to language acquisition <i>Marijn van Dijk and Paul van Geert</i>	14
Writing before age three <i>Deborah Wells Rowe</i>	27
Children's earliest insights in developing literacy <i>Liliana Tolchinsky</i>	38
Biliteracy, playfulness and performative practices <i>Pengtong Qu, Amanda Deliman, Gustave J Weltsek, Amy Walker, and Carmen Liliana Medina</i>	48
Systemic functional linguistic and disciplinary literacy development in multilingual K-12 schools in the United States <i>Meg Gebhard and Nicolas Blaisdell</i>	54
Literacies, language, and schooling: exploring writing pedagogy for English language learners <i>Erin Kim-Rich and Jen Scott Curwood</i>	65
Critical media literacy and second language acquisition <i>Andrea Gambino and Jeff Share</i>	76
Assessment of English learner students <i>Jamal Abedi and Cecilia Sanchez</i>	86
Assessment of young emergent bilingual children <i>Sandra Barrueco, Maria C Morales, and Lindsay M Truesdale</i>	96

Literacy/multiliteracies and foreign language education <i>Beatrice C Dupuy and Chantelle N Warner</i>	105
Critical literacies in East Asian languages: examples from Japanese in foreign language education <i>Yuri Kumagai</i>	112
Language policy and planning as a discursive accomplishment <i>Anthony J Liddicoat</i>	123
Transliteracy for a cosmopolitan future <i>Xiaoye You and Michelle Zaleski</i>	130
Rethinking multiliteracies: toward a radical vision for multilingualism <i>Brittany L Frieson, Luz A Murillo, Vivian E Presiado, and Jim Sosnowski</i>	138
Translanguaging and identity across global sites <i>Monica Shank Lauwo and Bonny Norton</i>	148

CULTURAL, CRITICAL AND COMMUNITY LITERACIES

Funds of knowledge and funds of identity: lenses for building language and literacy <i>María E Fránquiz and María G Leija</i>	159
Family literacies: differing perspectives <i>Jim Anderson, Laura Teichert, and Ann Anderson</i>	168
Toward culturally relevant literacies with children and families of color <i>Patricia A Edwards, Patriann Smith, and Jonda C McNair</i>	180
Literacy and identity across home, school, church, and social life <i>Gilberto P Lara, Sonia N Sánchez, Myriam Jimena Guerra, and Lucila D Ek</i>	198
Religious influences on the growth of literacy practice <i>Loukia K Sarroub and Cassandra Schroeder</i>	209
Critical literacies & social justice: social justice approaches in schools <i>Nerida Spina, Barbara Comber, and Michelle Jeffries</i>	217
Critical literacies and social justice <i>Ernest Morrell and Jodene Morrell</i>	225
Youth poetry and literacies in remaking the world <i>Korina M Jocson</i>	235
Youth out-of-school (critical) literacies, texts, and audiences <i>Kathleen A Hinchman</i>	242
The construction of gender in literacy <i>Barbara J Guzzetti and Katina Zammit</i>	250
Literacy at the intersections of race, gender, and sexuality <i>Latrise P Johnson and Mollie V Blackburn</i>	262
Literacy access, the law, and racism in the United States: a critique <i>Arlette Ingram Willis</i>	268
Learning disabilities' unsettling intersections: disrupting learning, cultural, socioeconomic, and environmental deficits <i>Adai A Tefera and Alfredo J Artilés</i>	279

Borderlands: unique sources of transnational language and literacy for educational research <i>Rosalind Horowitz</i>	288
Culture and literacy: situated social literacies <i>Martin Prinsloo and Lara-Stephanie Krause-Alzaidi</i>	296
LITERACY DEVELOPMENT & PEDAGOGY WITH CHILDREN, YOUTH, AND ADULTS	
Literacies, language & schooling: teaching and learning the language arts <i>David Bloome, Hilary Janks, and Allison Wynhoff Olsen</i>	308
Reading comprehension in troubled times <i>Gina N Cervetti and P David Pearson</i>	319
Collaborative Reasoning and children's development of language and thought <i>Shufeng Ma, Richard C Anderson, and Jingjing Sun</i>	330
Literature: critical imagination and young adult readers remaking worlds <i>Patricia Enciso and Beth Krone</i>	337
Humanizing language and literacy in education with dramatic inquiry <i>Brian Edmiston</i>	346
Arts-based practices for literacy & language learning <i>Douglas Fisher and Nancy Frey</i>	358
Which words to teach: review and reflection <i>Elfrieda H Hiebert</i>	365
Spelling: theory, assessment, and pedagogy <i>Shane Templeton</i>	374
The art and science of reading fluency and fluency instruction <i>Timothy Rasinski, Chase Young, David D Paige, and Kasim Yildirim</i>	388
Expanding meaningfulness for struggling readers <i>Gay Ivey and Karole-Ann Friddle</i>	398
The meaning(s) of dyslexia <i>Richard L Allington and Rachael Gabriel</i>	408
A constructivist lens of eye-tracking in special populations <i>Ryan L Nelson, Laura E Arrington, Narges Firouzshahi, Patricia Arias Hunt, Amanda Percle, Holly Damico, and Jack S Damico</i>	414
Issues and current trends of research in braille for people with visual impairments: questions and implications <i>Sunggye Hong</i>	423
Autism, literacies, and social communication: a framework of inclusive new literacies <i>Bessie G Stone and Beth Sagers</i>	434
Shifting from disciplinary versus content area literacy to a transdisciplinary approach <i>Thomas W Bean, Amy Wilson-Lopez, and Kristen Gregory</i>	448
(Mis)understanding adult literacy <i>Erik Jacobson</i>	456

College reading	463
<i>Norman A Stahl, Sonya L Armstrong, and James R King</i>	
Research and practice in literacy teacher education: imagining, designing, and engaging in "what could be"	474
<i>James V Hoffman</i>	

DIGITAL AND MULTIMODAL LITERACIES

Sensory literacies: the full sensorium in literacy learning	480
<i>Kathy A Mills and Beryl Exley</i>	
Expansive, dynamic, and critical new literacies: widening views of digital and multimodal learning	487

Introduction

How much do children know about using language by age 5? Normally-developing children typically know how to convey their wants and needs, how to answer questions, say what they are interested in, tell others what they have been doing, and what they want to do now. They can voice different roles in pretend play, and make up stories to accompany that play as they enact familiar activities like shopping, cooking, eating a meal, giving the baby (doll) a bath, searching for a lost puppy (toy), or acting out favorite stories. But what words and constructions have they acquired by this age in order to achieve such a range?

In this article, I begin by summarizing some of the early steps children take as they begin to follow a path into language use, and describe the differences between speech comprehension (leading the way) and speech production (lagging, sometimes quite far behind), and how these core processing skills together help children arrive at much already adult-like usage in speech interactions by age 5 (Clark, 2019a). I then take up in more detail what children need to know in order to set up a system of communication, from early gestures to gesture-word combinations, to more complex linguistic constructions, often emphasized or supplemented with gestures, by the age of 4 or 5 years. And I argue that children benefit greatly from extensive experience with language use from their parents and other adult caregivers, feedback of some kind, preferably tied to content, on their errors of usage along the way, and practice in all kinds of settings, practice in speech comprehension through exposure to a variety of speakers, and practice in speech production, again in a variety of settings—choosing and planning the forms appropriate for the intentions they are trying to convey, taking turns on time, and contributing appropriate information in their turns within an exchange. In achieving all this, children must take into account what their addressees already know (given information), and contrast that with information they are offering that is new. That is, they attend to what is currently in common ground, and so already known to the other, and what, at each step in the exchange, counts as new information, and so keep track of where the conversation is going. Talking with another person also means keeping track in the longer term of what that person knows, from any shared history of interactions on other occasions.

In acquiring a first language, exposure to and use of language in interaction is critical. Parents start out with fixed routines that accompany such everyday activities as changing nappies, feeding, picking up, putting to bed, and so on as they talk to their infants (Ferrier, 1978; Tamis-LeMonda et al., 2019). And adults elaborate on these, talking about what the young child is doing, treating it as an interactive partner by taking sounds, cries, smiles, reaches, hand gestures—any small action on the child's part—as “turns” in an exchange (Snow, 1977). They track babies' and small children's gaze as indicating attention and act so as to attract their gaze in setting up interactions (Moore and Dunham, 2014). They scaffold young children's single-word utterances and thereby model turn-taking in a conversational exchange (Bruner, 1983), and they make requests for clarification whenever they don't understand what the child is trying to say (Clark, 2020b). All this presents children with language used for interactive communication, where both words and gestures play a role, and where language is also an essential ingredient in coordinating with others in specific activities such as building a tower, doing a puzzle, getting dressed, going up stairs, playing catch, putting a doll to bed (e.g., Garvey and Kramer, 1989).

Getting started

Infants attend to their environment. They look at faces, patterns, angles, and corners. They follow gestures and the direction indicated by an adult point (Thoermer and Sodian, 2001). This attention on the child's part is critical for establishing and maintaining joint attention with someone else on an object, place, or action (Estigarribia and Clark, 2007). Even during early infancy, babies attend to the sounds they hear in the adult speech stream, discriminate same from different syllables, and recognize recurring sequences of sounds (Saffran et al., 1999). By 10 months or so, they begin to attend more closely to the sounds of the ambient language than to sounds from other languages (Werker and Tees, 1984) and even show early comprehension of a few words (Bergelson and Swingle, 2015). And, somewhere between 8 and 12 months of age, infants begin to babble, producing short sequences of syllables, with varying intonation contours. Most children go on to produce their first words, or first attempts at words, between 12 and 24 months. During their second year, they rely on both gestures and gesture-word combinations as they try to communicate with the people around them (Clark and Kelly, 2022).

Recognizing sequences of sounds heard from others and managing to produce sequences of sounds are two very different skills. Young children's recognition and comprehension of words spoken by adults is typically well ahead of their ability to produce recognizable versions of those same words (Clark and Hecht, 1983). In fact, even 1-year-olds monitor their own productions and try to correct them when they fail to match the adult targets they already have represented in memory. This can be seen, for example, in (1), where Brenda makes six attempts at the word *shoe* (Scollon, 1976):

(1) Brenda (1;8, talking to her mother as she held up her mother's shoe

and looked at it): *mama, mama, mama.*

sh. shi. sh. shiss. shoe. shoesh.

Mother: Shoes!

Young children also respond to adult prompts for clarification, making repairs to their own productions in response (Clark, 2020b), for instance, by improving the pronunciation of a word, as Brenda did, or by changing a word to make the meaning clearer (Clark and Bowerman, 1986), as in (2):

(2) D (1;9.5, looking at a picture of a crab, a word up till now pronounced as "kam"):

kab. (a minute later, same picture): *kam* <repair> *kab.*

Adding and storing words in memory

As children add adult words to memory, their comprehension vocabulary grows from just a few words at around 10–12 months, up to several hundred words by age 2. And their production of different words also increases steadily, (See Table 1) but rather more slowly than their comprehension (Fenson et al., 1994). The size of these early vocabularies, in both comprehension and production, covers a considerable range, affected in part by how much parents talk to their children (e.g., Arriaga et al., 1998; Hurtado et al., 2008). This in turn varies with social class and child-rearing beliefs, with upper- and middle-class parents typically talking more with their children than lower-class and welfare parents in the US (Hart and Risley, 1995; Heath, 1983) (Table 1).

Early utterances

Children start by saying just one word at a time (Bloom, 1973). But once they can produce more words that are recognizable, they also begin to produce an increasing number of two-word combinations. From that point on, they also attempt more complex constructions. They produce some modifying adjectives like *big* and *small* in combination with nouns, as well as a few color terms

Table 1 Early words, produced by at least 50% of children at each month of age from 1;0 to 1;6.

<i>People:</i>	daddy (1;0), mommy (1;0), baby (1;3), grandma (1;6), grandpa (1;6)
<i>Food/drink:</i>	banana (1;4), juice (1;4), cookie (1;4), cracker (1;5), apple (1;5), cheese (1;5)
<i>Body parts:</i>	eye (1;4), nose (1;4), ear (1;5)
<i>Clothing:</i>	shoe (1;4), sock (1;6), hat (1;6)
<i>Animals:</i>	dog (1;2), kitty (1;4), bird (1;4), duck (1;4), cat (1;6), fish (1;6)
<i>Vehicles:</i>	car (1;4), truck (1;6)
<i>Toys:</i>	ball (1;3), book (1;4), balloon (1;4), boat (1;6)
<i>Household objects:</i>	bottle (1;4), keys (1;5)
<i>Routines:</i>	bye (1;1), hi (1;2), no (1;3), night-night (1;4), bath (1;5), peekaboo (1;5), thank you (1;6)
<i>Activities (sound effects, motion, state):</i>	uh-oh (1;2), woof (1;4), moo (1;4), ouch (1;4), baa baa (1;4), yum yum (1;4), vroom (1;5), up (1;5), down (1;5)

Based on Fenson et al. (1994: 93).

(initially often wrongly applied), and they understand and ask questions (e.g., Tyack and Ingram, 1977; Kemler Nelson et al., 2004; Chouinard, 2007). From around 2;0 to 2;6 on, they actively ask for words for unfamiliar objects and actions, and readily take up new words when these are offered (e.g., Clark, 2007, 2010a).

In many languages, words can be modified in meaning with the addition of suffixes or prefixes. Such modifications may include inflections that mark singular vs. plural, possessive, male vs. female, and case marking for grammatical relations like subject vs. object. Other modifications in word meaning may be provided by function words, e.g., English *of*, *to*, or *with*. Children acquiring English produce some inflections and function words by age 2 (Brown, 1973). They use plural marking early, distinguishing one from more-than-one, sometimes relying first on a numeral (usually *two*) before resorting to the plural suffix *-s* on nouns (Clark and Nikitina, 2009); they also mark possession on nouns with *-s* early, as well as the regular past tense, with *-ed*, on verbs; and they produce a few prepositions like *in*, *but*, *to* begin with, again often use these incorrectly. By age 3, in English, children typically over-use the regular past tense *-ed* on irregular verbs, in such productions as *fallen*, *bringed*, *goed* (also *wented* with mis-identification of the verb stem), *runned*, and *eated*, but produce a number of other grammatical morphemes correctly.

Another early inflection, first produced at around age 2, is *-ing* added to non-stative verbs for actions with some duration (e.g., *boy running*, *dog barking*). This is followed by the auxiliary verbs *be* and *have* (*he's running*; *I have teddy*) as well as copula *be* in equative utterances (e.g., *doggie is big*). They mark gender with the pronouns *he* and *she* (though at first they over-use *he*), mark plural number with *they*, and otherwise use *it* or demonstrative *that* in their references. By age 4 or 5, children understand proximal *here* (close to the speaker) vs. non-proximal *there*, followed by proximal *this* vs. non-proximal *that*, and by age 8 or 9, have also mastered the conditions on deictic verbs like *come* (motion toward the speaker) vs. *go* (motion away from the speaker), as well their causative counterparts *bring* and *take* (see Clark, 1978; Clark and Sengul, 1978; Clark and Garnica, 1974).

As their vocabulary grows larger, children begin to produce more complex constructions by combining two or more propositions. And from around age 2;6 to 3;0 on, for example, they can talk about how events are ordered in time using *and then*, with the actual event order marked by order of mention (Clark, 1973), as in (3):

(3) L (~3;6, to teacher): *First you'll have your coffee and then we'll*

go outside (to the playground).

They also start to use conjunctions like *when*, *before*, and *after*, as in (4) and (5):

(4) A (~3;6, showing how to hold up a hand in a "stop" gesture):

This is what a policeman looks like when a car stops.

(5) D (2;6.22): *I going [ə] bring this pile of books to the table,*

after I aten my supper, then I can read them.

At first, children generally introduce temporal subordinate clauses in second place, after the main clause. But they soon begin to use some conjunctions to introduce first-position clauses as well, as in (6):

(6) D (2;5.3, starting a nap): when you close the door, then I can kick all my

blankets off.

Two- and 3-year-olds also talk about causes, external and internal, with *because*, as in (7) and (8), also with the subordinate clause in second position:

(7) E (2;5.21, going towards disks): get them cause I want it.

(8) D (2;3.30, to Father starting to clear the table): You don't get my bowl

because ... I still eating.

and about conditionality with *if* as in (9), in either first or second position:

(9) D (2;8.26, asking for a specific T-shirt): If it doesn't have writing on it,

it's not my Levi's shirt.

They also attempt relative clauses from around age 2 onwards, with varying degrees of success and frequent early omission of relativisers like *who* or *that*, as in (10) and (11):

(10) D (2;0): I see [ə] building Eve go.

(11) D (2;5.16, touching a wet spot on newspaper): That paper what

Eve got fell into a tiny puddle.

See Clark (1971, 1973), Diessel and Tomasello (2000), Donaldson and Balfour (1968), Jourdain and Lahousse (2021), Klatzky et al. (1973), Reilly (1986), Sheldon (1974).

Children acquire still more words and constructions from being read to, and later on from starting to read themselves (e.g., Noble et al., 2018; Seidenberg, 2017; Snow and Matthews, 2016). Overall, vocabulary acquisition involves long-term uptake, and it is not until early adulthood that many speakers of English attain a vocabulary size estimated at around 50,000 words. Indeed speakers continue to add new words on a life-long basis, albeit much more slowly after age 18 or so (Clark, 2016).

Taking up offers of new words

When talking with their children, adults make explicit offers of some new words, and children often take these up. They show this by repeating the words in the next utterance, and using them on subsequent occasions. These adult offers are typically flagged with specific frames like: *This is a—, That's a—, This/that is called a—, It's a—, Those are—* (Clark and Wong, 2002; Clark, 2007, 2010a; Clark and Estigarribia, 2011), as in (12) and (13):

(12) Naomi (1;8.6; Sachs 3:84/CHILDES)

Father: That's a pen (offer of word).

Naomi: *pen* (uptake with repetition).

(13) Abe (2;7.26; Kuczaj 26:245/CHILDES)

Father: What's he doing?

Abe: *I don't know. I don't know.*

Father: He's pulling a wagon (offer of word).

When adults offer new words, they often link them to other words the children already know. They indicate the kind of object in terms of set-membership or inclusion, e.g., *A seal is a kind of animal*, *A retriever is a kind of dog*, where the terms *animal* and *dog* provide familiar or known anchors for the new words *seal* and *retriever*. They offer information about properties or material associated with particular objects, using expressions like *is made of*, *is shaped like*, *sounds like*, *is the same color as*, and so on. They comment on parts of the newly-labeled entity, identifying such elements as *feet*, *hands*, *wheels*, etc. They may also provide lists of related objects or actions. And they sometimes offer explicit definitions for new words, as in the parental repair (underlined; Gelman et al., 1998), shown in (14):

(14) Child (2;11, looking at a book)

Mother: Do you know what that one is?

Child: *Ummm.*

Mother: I don't know if you know what that one is.

Child: *That's a snake.*

Mother: It looks like a snake, doesn't it? It's called an eel. It's like

a snake only it lives in the water. And there's another one.

The information provided along with such direct offers of new words helps children as they build up semantic domains--terms related to each other in meaning. Their very earliest domains consist of small numbers of words that are related in some way. Later the relations linking words become more varied and complex. Compare the set: "*Mummy, daddy, baby*," say, with the more elaborated set: "*Parent, mummy, daddy, child, boy, girl, baby, walk, eat, talk, cry, sleep, jump, shout, play, throw*," where the latter grouping

Table 2 The early domain of animal terms in one child’s speech (Clark, 1995).

I. Initial repertoire in the 2nd year (1;0.29–1;11.30)	
1;0.20	doggie, 1;1.15 dog, 1;3.3 mouse, 1;3.23 cat, 1;4.28 horse, 1;6.13 cow, 1;6.28 rabbit, 1;11.30 goat
1;1.26	bear, 1;7.19 lion, 1;8.8 alligator, 1;11.6 gorilla, 1.10.24 seal
1;2.0	turtle, 1;6.4 fish, 1;8.7 frog, 1;8.8 snake, 1;8.22 crab, 1;10.19 ladybug
1;7.20	animal
II. Elaborating the repertoire in the 3rd year (2;0–3;0)	
2;0.8	puppy-dog [toy dog], 2;2.24 baby-rabbit, 2;5.21 mummy-bunny [toy rabbit], 2;7.27 sheep, 2;11.1
cattle, 2;11.1	baby-cattle, 2;11.1 daddy-cattles, 2;11.3 bronco-horse, 2;11.10 bucking-horse
2;0.11	hippo, 2;1.7 camel, 2;4.10 baboon, 2;4.16 tiger, 2;5.21 monkey, 2;7.15 wolf, 2;7.15 raccoon, 2;8.8
armadillo, 2;8.8	fox, 2;8.17 beaver
2;3.21	stork, 2;3.21 ostrich, 2;4.6 robin, 2;4.17 sparrow, 2;4.19 flamingo, 2;4.20 dove, 2;5.10 grouse,
2;5.14	woodpecker, 2;8.6 owl
2;5.1	trout, 2;5.4 flounder, 2;9.21 lizard-animal [live], 2;9.21 frog-animal [live]
2;5.6	spider, 2;5.6 grasshopper, 2;7.2 fly, 2;7.2 bee, 2;8.14 butterfly

involves many more relations linking the words. Some words can be members of several, or even many, semantic domains, while others are more specialized in meaning: compare *baby*, *foal*, *calf*, and *puppy*, for example (Clark, 2010b, 2018b).

Acquiring new words allows children to build up semantic domains, with steady additions, for example, to their earliest words for animals, for toys, for vehicles, for household objects, for activities. This leads children to organize their growing vocabulary into groups that are related in meaning: terms for animals, with male/female and adult/young terms; terms for the noises particular animals make, for their characteristic motions and actions, for their usual food, and for their habitats, say (Clark, 2018b). Table 2 shows the gradual build-up in production of the semantic domain for various types of animal in the speech of one child. By the end of his 2nd year, this child used some 21 animal terms. He then added a further 37 terms to this domain in the next year. In a few cases, he constructed a compound form, produced with appropriate primary-tertiary stress, as in *baby-cattle* for a calf, or *lizard-animal* for a live lizard seen outside.

Coining words

When children (or adults) lack a word for a particular entity or action, they will often coin one on the spot. In English, from the age of 2 onwards, children rely extensively on compounding, combining two nouns with a primary-tertiary stress pattern, as in the examples in (15):

(15) a. D (1;8.5, at table, puts spoon in cup): *ORANGEJUICE-spoon*.

b. D (1;11.28, wanting *Lion in the Meadow*): read [ə] *LION-book*.

c. D (2;2, playing with a small and large strainer): *That [ə] TEA-sieve*.

Mo: What?

D: *That [ə] TEA-sieve* (then pointing at large strainer). *That [ə] WATER-sieve*.

(Clark et al., 1985; Clark and Berman, 1987; Berman and Clark, 1989). They also readily use nouns as verbs when they either lack or can’t retrieve the relevant verb (Clark, 1982, 1993), as in (16):

(16) a. D (2;4.13, grinding pepper onto counter): *I’m sanding*.

b. D (2;9.1, of a sock, to Mo): *And did you needle this?* [=mend]

c. D (2;9.10, talking about boats): *And we might see a man **oaring** a boat*

with oars. [=rowing]

d. S (3;0.21, watching a man open door with a key): *He's **keying** the door.*

By age 3, children also make ready use of the productive agentive suffix *-er*, as in (17):

(17) a. D (2;5.26, reaching across counter): *I'm a big **reacher**.*

b. C (2;4.18, of someone cooking) *She a **cooker**.*

c. C (3;7): *That's the **rainer**.* [=person who drives away the rain]

d. F (3;11, contrasting with "painter"): *He's a **crayoner**.*

But they take rather longer to master the less productive agentive suffixes, *-ist* and *-ian* (Clark and Cohen, 1984; Clark and Hecht, 1982). Other suffixes like adverbial *-ly* in English are acquired later still, as are prefixes like *un-* (Clark et al., 1995), as in (18):

(18) a. D (2;9.11, opening plug in bidet to empty water): *It's **unflowing**.*

b. D (2;10.20, hiding thumbs in his fists): *They've **disappeared**.*

Mo: Can you make them appear again?

D: *I can't make it **undisappear**.*

c. D (3;4.8, getting things out of school cubbyhole):

*That's a picture and you have to **uncrumple** it to see what it is.*

d. D (3;5.9, to Mo): *Show me how you **uncatch** your necklace.*

By age 5, children have mastered a number of the most productive options for forming new words in their language. They attend first to transparency in form as they construct new forms for new meanings, and in particular they attend to highly productive forms. In acquiring Germanic languages, for example, they start early with compounding and with zero derivation, while in Romance languages, they start early with derived forms, adding suffixes (and some prefixes) to existing forms, to construct new words. Cross-linguistically, children follow similar trends, but generally first latch on to those patterns that are productive in the language they are acquiring (Clark, 1993, 2019b).

Language in interaction

Children learn language in interaction. Adults talk with them and carry out actions with them along with their talk. Children must respond, show they have understood, and make their own contributions to any ongoing exchange in conversation (Clark, 2018a). But children start out knowing virtually nothing about language itself, and so rely at first on gestures, single words, and gesture + word combinations (Clark and Kelly, 2022). As they hear more language and get more practice in using words, they advance to producing some two-word combinations (Braine, 1976; Bowerman, 1973; Slobin, 1973).

In using more speech, children need to make sure they are making themselves understood by others. They monitor their own production to see that it matches what they have already stored in memory for comprehension, and they make spontaneous repairs to their own speech when they detect a mismatch between a stored form and the version they produced (Clark and Hecht, 1983). They respond to requests for clarification, whether Open requests like *hm?* or *what?*; to Restricted requests like *He said what?*, or to Restricted offers, as when adults reformulate erroneous child utterances in the next turn and so provide children with conventional forms that would convey what was apparently intended (Clark, 2020b; Chouinard and Clark, 2003; Clark and de Marneffe, 2012; Lustigman and Clark, 2019). In responding to clarification questions from adults, children consistently try to make clearer what they had meant.

Using language in interaction depends on being able to track what the addressee does and doesn't know. Establishing and then tracking common ground is central to language use, and children start to track what their addressee knows early on. They also start to take turns very early, in vocalizing, in passing objects in play, and then, with the onset of word production, in producing a word as a turn (Hillbrink et al., 2015; Snow, 1977). But timing with language is complicated since the child has to plan the next turn, and do so with minimal gaps between speakers as they take their turns.

One place we can see this is when children answer questions, both *yes/no* polar questions and *wh*-questions, as in *Do you want some cheese?* and *Where are your sandals?* In answering such questions, children must first understand the question and then decide how to answer. That is, the turn-taking involved in answering questions requires that children plan their answers. They need to retrieve the right words, put them together, then produce an utterance that responds to the question. Such planning takes time, and if speakers are to avoid gaps and overlaps as they take turns, they need to be able to plan the next turn before the current one is done. One domain where such turns have been examined is in the timing of young children's answers to questions. There, the gap between adult question and child answer is larger when the question is more complex, but this gap becomes smaller as children get older and more skilled in their turn-timing (Casillas et al., 2016; also Garvey and Berninger, 1981; Hillbrink et al., 2015; Stivers et al., 2018). Finally, very young children may know the answer well before they can produce the word(s) needed. In a case study of child answers to early *Where* and *Which* questions, for example, Clark and Lindsey (2015) found that the child produced appropriate gestures as answers faster than he did words.

Participants in a conversation keep track of what they've said and what the other person knows as a result of the exchange so far. That is, they keep track of common ground (Clark, 2015, 1996). This means keeping track of information status, what is already "given" in the exchange, and what is "new" information provided by each participant in the next turn.

How do children, and adults, present information as given vs. as new when they contribute a turn to the ongoing exchange? Young children distinguish given from new information very early, from the two-word stage on. New information in English is marked with heavier stress, and children make use of stress, as in *Book THERE* or *ANDY bed*, where the more heavily stressed term in each utterance conveys the new information being added. While they typically answer questions with new information alone, they make many contributions that add new information to something that has already been given (Baker and Greenfield, 1988). As they move on to more complex constructions, children assign whole clauses as given vs. new, as in *After his brother came in, he sat down at the table*, with the first clause here comprising given information and the second new information (Clark, 1973).

More generally, even very young children take the addressee into account, just like adults do, tracking what the other person can see, for example, as when a child holds up a book to display a page. At age 1 or 1;6, children will tilt the top edge of the book down toward the other person who, as a result, sees the target page upside down. But by age 2 or so, children turn the book in the horizontal plane instead, so the other person can see what the children had been looking at, upright on the page (Lempers et al., 1977). By age 2, children also keep track of whether a parent, say, had been present and so knows what happened earlier in what the child had been playing with (O'Neill, 1996). That is, children start tracking common ground from an early age, and so choose their actions and words to reflect the relevant perspective for the person they are talking with (Clark, 1997).

At the same time, children are building up information about categories and relations in the world around them, and about how to talk about them. They are also building up cultural knowledge about their surroundings and about how people around them use language. And they assign words to refer to those category types, gradually building up semantic domains for the conceptual categories identified, by building on their earlier conceptual development (Clark, 2018b). Critical to building up different semantic domains are the patterns of communicative interaction that surround the children. Reading to children helps expose them to new words and new categories. And talking to them about whatever is happening and what they are doing provides them with information about the words to use, and models of how to use them.

In short, conversational interaction, and how it is layered with ongoing collaborative activities, is central to adult language use (Clark, 1996; Enfield and Levinson, 2006; Kempson et al., 2016). It is also central when it comes to acquisition. Children learn their first language in conversational settings as they begin to understand others and try to communicate their own needs and intentions.

Conversational interaction provides the site where children gain more and more experience with language use, both in comprehension and in production. It is the site where they receive feedback about what they have (or haven't) understood as well as about what they have produced. And it is the site in which they practice what they have acquired so far (Clark, 2022). Conversational interactions therefore provide experience, feedback, and practice in language use—all three play an essential role during the process of acquiring a first language.

Other language skills

Early on, children learn to take different perspectives on the same referent as they choose terms for referring to it, and they start to use some figurative language quite early on, at around 2;6 to 3. At age 3–4, they begin to use stage directions in their pretend play, specifying actions as well as what to say in enacting specific roles. And they make more and more subtle use of persuasion when they make requests. And, by age 5, they have learned the basics of how to tell a story.

Figurative language

Some figurative uses of language appear to emerge quite early in children's spontaneous speech, starting at around age 2 or 3 (Billow, 1981; Clark, 2020a). That is, children that age can shift perspective and so refer to the same entity in different ways (*the waste-basket* vs. *my hat*). Such shifts in how to refer to the same entity license their extension of different terms to new contexts (Clark, 1997). This ability to shift perspective, combined with extensive pretend-play, appears to lay the groundwork for figurative usage. And, from age 3 onwards, children do well in understanding metonymy, for instance, where a term for a part is used to refer to the whole object, as in *the beard* for *the man with a beard*, as measured in an eye-tracking task (Köder and Falkum, 2020). Three-year-olds also do well in a choice task where they have to identify a referent and hand it to an adult, where the referring expression consists of a metaphor appropriate to what 3-year-olds know and to their current vocabulary (Pouscoulous and Tomasello, 2020).

In short, shifts in perspective on objects or events, together with pretend-play, provide a basis for extending language in various ways, and this allows for some early understanding and use of figurative expressions.

Pretend play

Children begin pretend play very early, enacting everyday activities (like dressing, sleeping, having a bath), initially with a parent, and then, as they get older, with siblings and peers. And talk is integral to this play. Even children as young as 2 or 3 distinguish whether they are talking as a character in a doll's house, say, vs. commenting outside of the play itself to an adult (Strömqvist, 1984). And as they get older, children give stage directions to their play mates, marking them with use of the past tense to signal non-present *irrealis* (i.e., the event has yet to happen) (e.g., Kaper, 1980; Garvey and Kramer, 1989; Sawyer, 1997). These stage directions may assign roles and in particular the actions that should follow, including talk, that need to be carried out in the play.

By age 4, children are quite adept at adjusting their own speech for different addressees. They adopt different styles of talk in explaining a Noah's Ark toy to a 2-year-old compared to a 4-year-old peer, or compared to an adult (Shatz and Gelman, 1973). Moreover, from as young as age 2, children take into account what the addressee doesn't know and supply the relevant information (see O'Neill, 1996; Liszkowski, 2005; Knudsen and Liszkowski, 2013; Marcos et al., 2021; Morgenstern and Sekali, 1999).

Children also adopt the appropriate speech style or register for any roles they take on as speakers. They contrast the speech to use as a toy or as a 2-year-old with that they use when enacting the role of an older child or an adult (Sachs and Devin, 1976). They are also adept at taking different roles, and the voices appropriate to those roles, in talk as-a-child vs. as-a-parent, as-a-mother vs. as-a-father, as-a-pupil at school vs. as-a-teacher, or as-a-child-patient vs. as-a-doctor (Andersen, 1990). They mark such roles with different vocabulary and construction choices to signal such social dimensions as relative power, status, and age. In short, by age 4–5, children can take into account a number of social dimensions that are regularly reflected in how people talk to each other. Their requests, when speaking as children, for example, are politer in form when addressed to someone with more power (father) than those addressed to someone with less power (mother): Compare the requests in "Ice-cream tastes nice, doesn't it?" vs. "I want some ice-cream." Assigning and taking on different roles, of course, also involves being able to switch perspective on how to refer to a particular individual, a younger brother, say, who has been assigned the role of baby vs. father in family-based play.

Politeness

Politeness formulas in language often involve routine expressions like *please* and *thank you*, as well as uses of modal verbs (*could you ...*, *would you ...*, *may I ...*), and other indirect forms such *would you mind ...* (which expects the answer "no" when the addressee agrees with the speaker). Address terms, whether one is expected to use a first name alone, a title and surname, and second-person pronoun uses, and kin-term uses, differ from one culture to another. And here too, parents offer extensive feedback on just what to say when the occasion demands it. Although children may start using some polite forms by age 3 or so, it may take considerable time before they use polite language appropriately, without prompting.

Very young children typically have politeness first imposed on them in the form of politeness routines: Say “please,” Say “thank you,” Ask “may I ...”, and so on (Gleason et al., 1984; Greif and Gleason, 1980). These routines provide early contexts for conventional expressions of politeness. And by around 2;6 to 3;0, children can judge which of two requests, say, is better, and so more likely to succeed (Bates, 1976). In one study of politeness in children aged 2;7 to 5;8, she looked at the forms of (nice) requests the children produced themselves, and at their comprehension of such forms, tested through judgments of which requests were the nicest or the best way to ask (Bates and Silvern, 1977). Children’s comprehension of polite forms was related to individual differences in social adjustment (as assessed by teachers), but their production and their explanations of what made an utterance polite were not. In their explanations, for example, children took into account of uses of *please*, the presence of modal verbs (*could*, *would*, *may*), formal or informal address (first name vs. title and family name), and direct vs. indirect requests in deciding which of two requests would be more successful.

By age 4–5, children can readily do the voices for dolls representing an adult, a peer, and a younger child. James (1978) elicited directives and requests from children aged 4;6 to 5;2, and found that age was the most important factor in their production of directives: Adults received the politest forms, followed by peers and then younger children. But when these children were asking a favor instead, all the requests they produced were more polite (see also Shatz and Gelman, 1973; Andersen, 1990; Ervin-Tripp et al., 1990).

Persuasion often accompanies requests, as when children spontaneously attempt to get a parent to buy a toy they have seen (Axia, 1996). Four-year-olds are fairly direct in their requests here, and typically don’t anticipate adult reactions when they ask. Six-year-olds are more strategic and take some anticipated adult objections into account when they make their requests. But it is not until age 8 that children both anticipate adult objections and tailor their requests in a cooperative way as they bargain for what they want.

Telling stories

Children start to tell stories early on, minimalist stories about what they have been doing. From age 3 or so, these stories are often prefaced by “*You know what?*” followed by two or three narrative utterances. Later, children often adopt a formulaic starting point such as *Once upon a time ...* as they start in on their telling (e.g., Umiker-Sebeok, 1979; Stone, 1992; Berman and Slobin, 1994). But good story telling takes more planning than this. Children must learn to identify the setting of the action, the main and subsidiary characters, each event in the action, and the culminating event that ends the story. This means keeping track of each character as well as any background information, and the role each plays in the actual sequence of events (see Karmiloff-Smith, 1981).

The planning required to do all this appears to be a lot more complex than simply planning one’s next utterance in a conversational exchange. Children take time to learn how to do this, even with simple stories where they have a picture book like Meyer’s *Frog, where are you?* in front of them, with each page acting as a prompt. At age 5, children’s stories are still often quite rudimentary in form, but as they get older, they get better at keeping track of all the characters, and in particular of the main character, in the events being recounted. They learn to add background information about the setting and about the emotions involved, and they present a more coherent account of the sequence of events as they get older. The same trends can be seen cross-linguistically, as children pick up on the conventions within each language for how to tell a story (Berman and Slobin, 1994).

Crosslinguistic comparisons

While most of the illustrations here have been taken from children acquiring English, children acquiring other languages go through very similar stages, and appear to apply similar strategies in how they communicate as they acquire the language they are being exposed to. Slobin (1985-1997, in five volumes) presented research on English, German, Hebrew, Hungarian, Japanese, Kaluli, Polish, Romance languages with emphasis on French, Samoan, Turkish, and American Sign Language (volumes 1 and 2); Georgian, West Greenlandic, K’iche Maya, and Warlpiri, as well as Mandarin, the Scandinavian languages, and Sesotho (vol. 3), and Finnish, Estonian, and Hungarian compared, Greek, and Korean (volume 4). These volumes offer an important starting point for looking at similarities and differences by language and cultural context. And, as Slobin pointed out, the general approach children appear to take to language, the strategies they apply during acquisition, are very similar. This work has encouraged the collection of acquisition data from a variety of additional settings, including indigenous rural communities in Mexico for Tseltal (Casillas et al., 2020), and in Papua New Guinea for Yelî Dnye (Casillas et al., 2021). There has also been considerable research on the acquisition of indigenous Australian languages (see Kelly et al., 2015) as well as on other less well-studied languages (see, e.g., Jancso, et al., 2020). In short, recent years have seen considerable progress in the documentation of just what children know when about the particular language they are in the process of acquiring. Such data offer valuable insights into the role of child-rearing beliefs, for example, and cultural norms, as they are applied to young children in diverse settings. They also reveal similarities in the stages children go through as they acquire a first language.

Conclusion

By age 5, most children can use language appropriately in a variety of settings, with a variety of addressees. They have some sense of differences in understanding and in talk for 2-year-olds vs. their own peers. They are aware that speakers differ in their use of language depending on age and status, and they associate different degrees of politeness with different social roles depending on age, status, and relative power. They can plan appropriate answers to questions, and can tell personal stories, as well as attempt to re-tell familiar tales. They can give “stage directions” for different roles in pretend play, adjusting these on the fly as the “play” proceeds. They can be persuasive, and justify their requests. And they can keep track of what the other person knows as they pursue a conversation. By age 5, children are on their way to becoming more fluent speakers, speakers who can take into account what their addressees already know, and they are becoming more skilled in how to use language in a variety of settings, for a variety of purposes, with a variety of different people.

Dynamic systems approaches to language acquisition

Though language has been studied for centuries, many questions with regard to its forms, evolutionary pathway, and acquisition are still unanswered. One of the main problems of language acquisition is whether it is a matter of transmission and appropriation or whether it is brought about by processes of self-organization and emergence. In the first case, the properties of a language are being transferred from a mature speaker to a novice learner or from an innate universal system to a manifest language use. In the second case, language emerges as a result of a child's use of it in a context of activity with other language users. In this chapter, we will describe a specific interpretation of this latter perspective on language emergence and elaborate on dynamic systems approaches to language acquisition. We will start by providing a general description of this theoretical framework, explain its main concepts and discuss the implications for research. After this, we will provide a short narrative review of the main empirical findings of dynamic systems-oriented research in both first and second language acquisition. We will finish this chapter by critically reflecting on what the dynamic systems approach has yielded and discuss some future directions.

State spaces and trajectories

Generally speaking, dynamic systems approaches specify how something changes over the course of time. This can be any kind of ability, such as a child's movements, understanding of the world, and language use. If something changes, there is a current state, and there is a state into which it changes. This "something" is defined by the set of all its possible states, for instance all possible states of a child's language use. This set of all these possible states is called the system's **state space**. A state space consists of a hypothetically unlimited number of dimensions (one for each of the possible properties of the states), and the number of states may vary between 1 and virtually infinite, depending on the choice of the researcher. For instance, if we focus only on the words in an utterance, we can use a one-dimensional state space that captures the number of words on a single axis. However, this one-dimensional state space can easily be extended to include other dimensions, such as the syntactic nature of the utterances, the word types that are used, etcetera.

At each particular moment in time, a system occupies one particular point in the state space, represented by the values it has on each of the quantitative or categorical dimensions. For instance, when a particular child uses the sentence "want milk," he or she occupies the state of the two-word utterances in the dimension of utterance length and the state of "present tense" in the dimension of verb tense (see Fig. 1 for an illustration). During a single conversation, the child may use mainly one and two words utterances and each utterance represents a consecutive state in the state space. That is, during the conversation, the child only moves within a limited region of the state space.

Fig. 1 State space representation of the utterances of a child in a conversation.

If we connect all the points of a particular child's conversations over time, we obtain a line or **trajectory** in this state space. This is represented by the lines in **Fig. 1**, where the arrows show the sequence of events. It should be noted that the lines do not represent a "fit" of any kind between datapoints; they merely connect each event with each consecutive event. However, the sequence of data-points and lines between them can be used for further statistical analysis (e.g. cluster analysis, temporal analysis). It is likely that the trajectory will be irregular, but that this variability will be confined to a particular region of the state space. If we wait long enough, the trajectory will probably have moved either from one region in the state space to another, e.g. from dominance of one-word utterances to the dominance of multiword utterances or from a narrow to a much larger region, e.g. from one-word utterances only to utterances between one and four words. The trajectory between these regions can be relatively smooth or quite erratic, with gradual versus sudden changes. In dynamic systems theory, this real trajectory, with all its temporal properties, is the phenomenon of interest.

Self-organization and emergence

According to a dynamic systems approach, developmental trajectories are not imposed in the form of an in-built design or explicit external control. Instead, they result from the dynamics of the interacting components: they are self-organized patterns. **Self-organization** is a core feature of language development. Since the components in a system (or state variables) form a network of connected and interacting ("coupled") nodes, all components work together to generate effects on the system. An example of such coupling in the domain of child language acquisition exists in the interaction between the language of the child and the child-directed speech of the parent. From the literature we know that parent and child coordinate their language during a conversation and over conversations (see for instance [van Dijk et al., 2013](#)). The principle of coupling is easy to imagine with components such as parent and child, but holds for almost any set of components, e.g. meaning and form, verbs and nouns, nouns and determiners, etc. These interactions are often bidirectional (or cyclical), for instance the parent's child directed speech has an effect on the child's speech and vice versa. Some of the couplings between components are supportive whereas others are competitive ([Van Geert, 2003](#)). The relations can also be symmetric or asymmetric, direct or indirect (run via other components), and more or less complex (for instance, they can be pre-conditional, non-linear, etc.).

A complex system typically consists of many interacting nodes. The interactions of the coupled components of such a complex system generate **emergent properties**. This means that these properties are novel and cannot be reduced to an addition or superposition of the properties of their components. For instance, usage-based theories of language acquisition show how a syntactic category such as "noun" or "verb" may emerge out of processes of language perception and production, cognitive processes of statistical frequency learning and so forth. Once such categories have emerged, they interact with the already existing processes of language perception and production. Emergence is of fundamental importance for all developing systems.

The concepts of emergence and self-organization are often used interchangeably, probably because their typical effects co-occur. Self-organization implies that the interactions between system components without external control lead to self-maintaining patterns of interaction (in a relatively small region of the state space). Such patterns can be the cause of novel properties that become part of the system (emergence).

Given the dynamics that govern the interactions between their components, many dynamic systems move toward self-reproductive and self-maintaining states. Such states are dynamically stable, and are being referred to by the term "attractors." The construction of sentences on the basis of a limited set of syntactic rules can be seen as an attractor, which is achieved through a trajectory of producing one-word sentences, to forming simple sentences based on combining words, and finally to using

grammatical rules. A system may have one stable attractor or several, it may cycle between attractors, or show attractor states in the form of complex repetitive temporal patterns (i.e. recurrent patterns).

Layers of organization and time scales

Complex systems self-organize into interacting layers of organization. This means that each of the system's components can be conceived of as a complex system itself, all the way down to the most elementary quantum physical interactions. This also applies to its time course or temporal evolution. For instance, in language, there are processes on the level of utterance formation (for instance all the physical and bodily processes that are involved in saying "I want more milk") and there are processes on the level of conversations which consist of sequences of interacting utterances (e.g. a conversation about milk). There are also processes on the level of language acquisition itself, which consists of changes in form and content of conversations, corresponding among others with changes in form and content of utterances (from "want milk" to "I want more milk"). These events, which are in fact patterns of change, are typically **nonlinear**. Nonlinearity implies that causes and effects are not proportional or additive. Examples of important nonlinear effects are sudden rapid changes, regressions, phase shifts and discontinuities. For instance, in the case of language acquisition of a particular child, a certain correction by a parent might have virtually no effect at one moment in time. But for another moment in its development, such corrections might have huge effects: they push the system over the edge or make it tip, metaphorically speaking. This "pushing over the edge" can refer to the concept of a phase shift (indicating a rapid transition between developmental stages) or even a discontinuity (indicating an abrupt change between discrete stages). These typical nonlinear effects occur on their own proper timescale, for instance the timescale of months and years in the case of the acquisition of syntax or the timescale of seconds or minutes that governs the dynamics of utterance production.

Process causality

Self-organization and emergence imply a particular view on causality, called "**process causality**." This is fundamentally different from the causal model we are used to, namely that of "intervention causality," which defines a cause as a specific intervention or natural event producing a specific effect. Take for instance the question of whether parents' reading books to their toddlers are a cause of their toddlers' accelerated vocabulary development. Assume that we have found a statistically significant difference in average vocabulary between a reading and non-reading group, is reading the cause of the effect, greater vocabulary? Interpreting this finding, we must first, realize that the cause is an iterative process, that is a sequence of connected events (e.g. the child's asking to be read, the ritual of reading before going to bed, the routine of doing so over a great number of days, etc.). Second, because this is a coupled dynamic system, the causal process is bidirectional or cyclical. The reading, for instance its continuation over a sufficient period of time, depends on the child's interest, attention, willingness to participate, eagerness or lack thereof and so forth. Third, because this is a complex system, the "behavior" of the system is an emergent property of the interactions between all the relevant components. In the case of reading and vocabulary development, those components involve material conditions, housing, availability of age-appropriate books, presence of other children, availability of other activities to spend time with, reading done by parents and siblings and so on. This means that the process is multi-causal, in spite of the fact that the intervention (in this case the reading by the parents) suggests a mono-causal event (it is only the reading that was manipulated). Fourth, the causality is contextual, which means that it is something that occurs in concrete, specific complex systems, e.g. concrete families. Given that such systems are usually highly **idiosyncratic** (family- or person-specific), the causal process itself is also likely to be highly idiosyncratic. Group averages, for instance over a sample of parent-child dyads, should not be confused with the real causal effect. Because development is such an idiosyncratic and nonlinear process, there is also a large degree of unpredictability on the level of individual parent-child dyads.

Variability is an intrinsic feature of a complex system's trajectory

We already noticed that observed trajectories in state spaces display **variability** over time, over different timescales. For instance, the number of words in each utterance will fluctuate, but there will also be fluctuations in the average number of words over consecutive conversations. According to a dynamic systems interpretation of development, this variability is a real and developmentally important property of the system. It emerges out of its multi-causal structure and is a typical indicator of its complexity. For instance, temporal variability provides contexts of exploration, parental modeling or correction. It is important to note that the cause-and-effect relationship between variability and development is complex: variability and context create each other and drive development.

Variability has a temporal structure that is different from random variation about a central tendency, and that is not a linear function of the known variables. It has been proposed that a "fractal" pattern of variability (a pattern which has a degree of "self-similarity") is optimal in the sense that it suggests coordination.

Implications for research methodology

The dynamic systems theoretical framework—with its explicit focus on the system as a whole, with nested layers and timescales, bidirectional interactions, nonlinearity, variability, and idiosyncratic pathways—has clear implications for the way development

in general and language acquisition in specific should be investigated. One of the main consequences is that it should in principle focus on the system as a whole, and thus include all factors that are part of it and that influence it (see [Larsen-Freeman and Cameron, 2008](#)). Context should not be seen as an external source of error, but as part of the complex system that provides important information. A dynamic approach demands a holistic perspective on the system, instead of attempting to take it apart. In practice, however, including all relevant variables of a system in one specific study is impossible, but researchers should specify at least the most important variables and the way they interact with each other. When selecting these variables, they must be treated as collective representations of many underlying components that are codependent on one another rather than treating them as independent variables that can be isolated from one another. Researchers should also rethink the units of analysis they choose, for instance by identifying collective variables that characterize the interaction among multiple elements over time.

A second implication is that researchers should think in terms of dynamic processes and changing relationships among variables (see also [Larsen-Freeman and Cameron, 2008](#), p. 206). This means moving away from analyzing unidirectional and/or linear influences from “independent” variables onto “dependent” variable(s). Instead, researchers should always consider bidirectional (reciprocal, cyclical) causality and nonlinear interactions between layers of development and timescales. In fact, studies should explicitly seek linkages across these layers and timescales.

Third, because of the idiosyncratic nature of development, analyses must be conducted at the level of the individuals (that is: trajectories of individual learners, individual dyads, individual classrooms, etc.). Analyses should focus on nonlinear forms of development, and on intra-individual variability as a central property. This means that the time-dependent properties should be seen as fundamental, and not be treated as noise added to underlying, stable or slowly and smoothly changing traits or variables. Currently, several statistical techniques are available to investigate the temporal patterns of variability in data with long time series, such as spectral and fractal analysis and recurrence quantification analysis.

There are various types of studies in the field of language acquisition that are compatible with these recommendations. These include longitudinal (multiple) case studies with extended and frequent measurement points, and studies on micro-development (short time serial design with intense measurements; conversation analysis). Dynamic systems research is also well known for its model building and simulation studies in which the underlying relations between components/variables are described in the form of coupled mathematical equations. These models are based on dynamic assumptions, such as the inclusion of the most relevant variables of the system, the focus on dynamic processes, including bidirectional causality, the investigation of linkages between time scales, and the emergence of higher order stability through interactions at the micro level. According to [Larsen-Freeman and Cameron \(2008\)](#) experimental designs can also qualify as dynamic studies when they pay attention to the real-time processes of change, are ecologically valid and keep away from reductionistic thinking.

Findings from studies on first language acquisition

Various publications on L1 development explicitly refer either to “dynamic systems,” “complex systems,” or to “DST.” Though the majority of these contributions are solely theoretical (e.g. [Larsen-Freeman and Cameron, 2008](#)), several studies cite empirical work published elsewhere (e.g. [Hockema and Smith, 2009](#)), or contain original data that are analyzed/interpreted in a dynamic way (e.g. [Hohenberger and Peltzer-Karpf, 2009](#)). With regard to those studies that either include or refer to empirical data, many of these explicitly name various dynamic constructs—such as self-organization, variability and non-linearity—as being relevant for first language development. In the empirical sections of these publications, there is often a focus on only one or two dynamic aspects which existence is being demonstrated.

In the sections below, we will organize some of the main empirical findings and directions along the lines of the implications for research as describe above. First, we will review several important studies on first language acquisition with an explicit focus on the system as a whole either by investigating the interactions themselves or by using collective variables. Second, we will discuss studies with an explicit focus on self-organization and emergence as central phenomena (for instance by investigating layers or time scales). Third, we will review studies directed at non-linearity and variability in trajectories of first language acquisition. Finally, we will refer to some of the model simulation studies and report what they have taught us.

Bidirectional interactions and collective variables in L1 acquisition

Various studies have offered descriptions of reciprocal influences and/or have analyzed collective variables to describe and explain developmental pathways. As an example, in [Van Dijk et al. \(2013\)](#), we have presented a coupled growth equation model on the **bidirectional influence** between early child language and child directed speech by the parent. This model describes the interaction between the language input from the parent and language growth in the child. The model was validated with developmental data of three children and those of the CDS of their caregivers (MLU and vocabulary) and was shown to have a good fit for all variables, except for one. These results can be seen as “proof of principle” for the existence of a dynamic form of adaptation between child-language and child directed speech. This study is a typical example of a dynamic systems interpretation because it describes mutually interacting variables that are treated as collective representations of underlying interacting complex systems.

With regard to using **collective variables**, [Hsu and Fogel \(2001\)](#) investigated infant vocal development as a precursor to language development. Based on observations of infants and their mothers in a face-to-face interaction, three global patterns of communication dynamics were classified: symmetrical (mutual engagement), asymmetrical (mother active/infant inactive), and unilateral

(mother active/infant disengaged). Further analysis showed that the quantity and quality of infant vocalizations were associated with these patterns of mother-infant communication and that these associations changed developmentally. Whereas a curvilinear growth pattern of the rate of syllabic vocalizations was found for symmetrical communication, a linear increase was found in unilateral communication. This study demonstrates the use of collective variables, but also shows how these are related to longer-term developmental pathways.

Parladé and Iverson (2011) also combined the use of collective variables (in this case: temporarily coordinated communication bouts) to the shape and form of developmental trajectories, more specifically in relation to the existence of a phase shift in language acquisition. This study analyzed the relation between the vocabulary spurt in the infant and co-occurring changes in patterns of caregiver-child communication. Infants who showed a discrete transition point were identified as “spurters,” and were compared to infants with a more gradual vocabulary spurt. In addition to coding vocal, gestural, and affective behaviors, a second-order variable was constructed for those communicative behaviors that co-occurred in time (“coordinated bouts”). The results showed that on average, infants who were identified as spurters had a greater disruption in the communicative system during this transition period than more gradual word learners.

Combined, these studies show how researchers can focus on language acquisition in a “holistic”/dynamic way, and what type of knowledge this yields. In these cases, the studies provide evidence for the existence of a complex relation between child-caregiver patterns and the child’s individual language acquisition trajectories.

Self-organization and emergence in L1 acquisition

With regard to the study of L1 development, several authors (particularly researchers collaborating with Linda Smith) have investigated the topics of self-organization and emergence by analyzing the linkages between time scales of language development or between layers of the nested structure of language. For instance, in their review article, Hockema and Smith (2009) present an overview of research, and argue that “[it] shows to be a self-organizing process in which children create the units they need from the regularities present in the environment in which they are situated.” (pp. 453). These authors argue that the causal factors are changing from moment to moment, and that the accumulation of these changes create higher order structure. The study includes a review of studies in the domain of lexical learning that support this conceptualization, for instance with regard to phoneme use (Maye et al., 2002), word segmentation Saffran et al. (1996, 1997) and Aslin et al. (1998), the use of syntactic and semantic categories (Mintz et al., 1995, 2002; Redington et al., 1998; Cartwright and Brent, 1997; Elman, 1990, 1998; Brill, 1991; Finch and Chater, 1992), word meaning (Landaauer et al., 1998). According to Hockema and Smith, this demonstrates that language acquisition is rooted in the “surface” regularities of any particular language, and that higher levels of organization are built every step of the way.

A similar approach was followed by Ibbotson et al. (2019), who explored the extent to which syntactic structure emerges from the interaction of simpler entities (in this case: words). In this specific instance, the authors used a dynamic network model to show how naturalistic child directed speech causes the formation of “communities” around words that were more densely connected with other words. In addition, experimental studies have shown that infants can aggregate and make statistically appropriate decisions from word-referent co-occurrence data in order to learn new words. In line with this, Colunga and Smith (2008) have argued that word learning requires the adaptive flexibility that integrates the stability of past experience with the specifics of the moment, and uses this in the context of children’s novel noun generalizations. By using three different experiments they show how young children flexibly and smartly adapt to novel circumstances in the task of learning new words. According to the authors, this shows that noun acquisition is a system that through its own self-organizing processes builds the knowledge that creates stable categorization patterns.

These examples of studies presented above show that stable patterns of language acquisition emerge as the result of underlying processes of self-organization, and that higher order structures are formed because of the repeated interactions at a lower level. This phenomenon is observed at different levels of language development, such as phoneme use, lexical development, and the use of syntactic and semantic structures.

Nonlinearity and variability in L1 acquisition

The study into nonlinear trajectories has received relatively much attention in dynamic systems oriented empirical studies of first language acquisition. The reason for this might be that first language research has a longstanding tradition of looking at individual trajectories and that most researchers are well aware of its nonlinear and idiosyncratic nature. The framework of complex dynamic systems offers a coherent theory that explains why development shows itself the way it does. In addition, the approach offers appealing theoretical constructs that can be observed and analyzed by means of a broad spectrum of methodological tools. As a result, various types of nonlinearity have received attention in the literature on L1 development, such as temporal regressions, rapid growth, discontinuities and intra-individual variability (see Fig. 2).

Temporal regressions are highly relevant for first language acquisition. The best known example of such regression is the u-shaped trajectory (see Fig. 2A) of verb inflection of irregular verbs (Carlucci and Case, 2013). In fact, Gershkoff-Stowe and Thelen (2004) have argued that temporal regressions are actually characteristic of all developmental processes. Aside from referring to some well-known examples from perception and action (particularly reaching in the A-not-B task), these authors use language development to illustrate how the same kind of perseverations takes place in word naming. Here, the temporal regression was explained by the changing patterns of activation and decay in the use of individual words. The authors refer to data from a study of

Fig. 2 Examples of nonlinear development: (A) temporal regression as u-shaped growth, (B) rapid continuous development in logistic growth, (C) discontinuous development, (D) intra-individual variability with underlying logistic curve.

Gershkoff-Stowe (2002) that showed that practicing naming objects can reduce the likelihood of perseveration errors during the period of increased vocabulary growth. The results of this study have demonstrated that children consistently made more errors with the target words when they were less practiced and that errors in low-practice words spiked during the vocabulary spurt. This suggests that the temporal regression resulted from multiple contingent processes mediating between the developmental history and the task.

The question of whether **discontinuities** exist in language development is also prominent in the literature. Stage descriptions of first language acquisition have been present already in the first studies of child language, but the question is whether these mainly concern qualitative differences or whether such stages also lead to abrupt changes in a quantitative sense with regard to language use. There are different definitions of a discontinuity, but the most intuitive one is the observation of a sudden change in the trajectory, that is a “jump” between two modes of functioning with a “gap” in between (see Fig. 2C: the gap is represented by a dotted line). As an example of investigating discontinuities, Ruhland and van Geert (1998), have conducted a quantitative study on the development of function word use between the ages of 18–34 months. The trajectories of six children were modeled with both a continuous model (a logistic growth curve, see Fig. 2B for an example) and a discontinuous one (the cusp model). The results show some evidence for rapid change and multimodality, but most findings supported the continuous model of development.

A similar approach—though not by using the cusp model—was taken by Hohenberger and Peltzer-Karpf (2009). These authors focused on detecting phase shifts in the development of lexical categories and MLU-curves. The data that were cited consists of a linguistic corpus of one monolingual (German) and one bilingual (English/German) child who were followed between the ages of 1; 5 and 2; 6 (e.g. Zangl, 1998). The results showed a qualitative and quantitative change around the age of 2 years suggesting a critical point in input processing, which according to the authors coincides with a highly active phase in brain development.

In addition, Rvachew and Bernhardt (2010) have focused on discontinuity in early phonological acquisition. This discontinuity exists in the form of sudden appearance of phonemes or structures and of regressions in speech production (Stemberger et al., 1999; Ullrich et al., 2008; Vihman and Croft, 2007). The authors argue that in all of these examples, the discontinuity (the emergence of a new behavior) is built upon a fundamental underlying continuity (gradual improvements in the child’s abilities with respect to the requisite subcomponent skills).

In Van Dijk and van Geert (2007), we have also suggested that development is not either continuous or discontinuous, but that it is simultaneously continuous and discontinuous with respect to different dimensions of development. Here we focused on detecting discontinuities in naturalistic data of preposition use. In contrast to other studies, data were used that included the variability as part of the change pattern. Four criteria were used to test the development of four children and the results show large individual differences: whereas two participants showed clear evidence for a discontinuity, the results were much weaker for two other participants.

The contributions described above on the detection of discontinuities have raised important questions about both the shape and the nature of the underlying process of first language acquisition. What these studies have added is empirical evidence for the

conceptualization that both continuity and discontinuity can be observed at the same time across domains of early language acquisition.

Various researchers have investigated the role of **intra-individual variability** (or “temporal variability”) in early language acquisition. During this process, there are constant interactions between the child’s many internal states (cognitions, emotions, etc.) and the context (Van Geert and Verspoor, 2015). As a result, the language of the child is different from moment to moment, from conversation to conversation, from day to day, and from week to week (see Fig. 2D for an illustration). Intra-individual variability can be part of any type of underlying trend (linear, logistic, u-shaped, etc.). However, when a system or subsystem is moving from one stage to another, the system destabilizes which leads to an increase of variability in behavior. Applied to data of first language development, it has been confirmed that MLU is highly variable, and that this may be meaningful for development (Van Dijk et al., 2001). There are also some experimental studies that investigate the role of temporal variability, for instance the one by Twomey et al. (2018) on word learning. In their design, 2-year-old children watched novel and known objects, and simultaneously heard a novel or known word. Whereas one group received constant color condition objects appearing on a uniform white background, another group received variable color condition backgrounds. The results showed that only children in the variable condition showed retaining label-object associations. The authors have argued that these findings are consistent with dynamic systems accounts because they show how variability leads to a change in behavior. We reported a similar result in a longitudinal study on spontaneous speech under naturalistic circumstances (van Dijk and van Geert, 2011) where we analyzed the use of prepositions in combination with utterance length. The data of two children showed that both had a relatively stable period with agrammatical preposition use first, through a period of relative variability, to a new stable phase of grammatical preposition use.

Intra-individual variability is also studied in relation to the detection of discontinuities or sudden changes in first language development. A few authors have used the framework of catastrophe theory to predict properties of variability associated with such transitions (van der Maas and Molenaar, 1992). For instance, in the case-study presented by Bassano and van Geert (2007), the intra-individual variability in the use of utterances of a certain length showed two statistically significant peaks, which coincided with rapid changes in the two- and three-word sentences and the 4+-word sentences respectively. These peaks in variability suggest that the process does not reflect a gradual change in utterance length, but that the utterance length is likely to be the consequence of underlying mechanisms of sentence formation that are organized in the form of different attractors.

As argued above, intra-individual variability has an internal structure which provides information about the underlying language acquisition processes. This phenomenon has been studied in both the studies of Cox and van Dijk (2013) and Dale and Spivey (2006) that each investigated the process of syntactic coordination between child and caregiver by means of cross-recurrence quantification analysis. The analyses did not only employ dyadic measures (that is: measures that are collective and capture the system as a whole), but also investigated the structure of the interactions in terms of their temporal variability. The results demonstrated that complexity of the behaviors changes over time, indicating a process of coordination between child language and child directed speech.

In sum, the study of first language acquisition has a long tradition at investigating individual developmental pathways and many studies have demonstrated that language development is nonlinear. More recent studies have shown that various shapes exist, such as u-shaped development, rapid continuous growth and in some cases discontinuous change, which is compatible with dynamic systems principles. In addition, studies that contain a sufficient amount of measurement points demonstrate large intra-individual variability. The amount and structure of this variability is not random, but is likely to relate to the underlying process of change.

Modeling L1 acquisition

As mentioned before, dynamic systems research is also known for its use of mathematical models to describe change processes. These models are based on coupled equations and are able to simulate the way the components of the system interact to produce trajectories of change. These models have been applied to various domains of child development among which first language acquisition. An example of such a model was already mentioned above, where the relation between the language production of the child and the child directed speech of the caregiver was expressed in a series of coupled equations (van Dijk et al., 2013). In addition, McCune and Zlatev (2015) proposed a conceptual threshold model to describe the transition to referential language. Here, they assume that certain developments in reaching prompt the transition to referential word production and/or comprehension. The model consists of four variables (representational play, vocalization, gestures, and communicative grunts) that all interact with each other from moment to moment and that predict use of references in child speech.

A very influential growth model, was proposed by Van Geert (1991) which was based on the logistic growth equation. The data on the lexical development of case-study “Keren” (as reported in Dromi, 1986) were used to specify the parameters in order to fit the data. Robinson and Mervis (1998) applied the same model with data from another child (“Ari”) and demonstrated that both lexical and grammatical development could be fitted with this logistic growth curve.

In sum, these studies show that relatively simple mathematical equations lead to a model which in many cases can be validated by means of empirical trajectories of children’s language use. As said, these models are based on underlying dynamic assumptions, such as the notion of process causality (implying the notion of iterativity), inclusion of the most relevant variables of the system, self-organization, the emergence of higher order stability through interactions at the micro level, etc.

Findings from studies on second language acquisition

In the globalized society of today, most individuals acquire a second, third or fourth language, either in a natural or emersion context, or in an instructional setting. Various authors (such as van Geert, Larsen-Freeman, de Bot) have proposed dynamic systems theory as a candidate for an overall theory of language development and have argued that its ideas are highly relevant for understanding second language (L2) acquisition. Pioneering work on the application of the theoretical constructs to this field was done by Larsen-Freeman (1997, 2002), and this was followed up by Herdina and Jessner (2002). Some years later, Verspoor, de Bot and Lowie published a series of influential papers (Verspoor et al., 2004; De Bot et al., 2005) inspired by these early interpretations and by the work on first language acquisition (Van Geert, 1991; Van Geert and van Dijk, 2002). These authors have also contributed with a series of empirical studies, of which many are based on quantitative measures of complexity, accuracy and fluency of produced language (so-called “CAF measures”).

The main theoretical issues that have been addressed by studies on second language acquisition from a dynamic systems approach are: (1) the existence of complex interactions between variables, (2) the unpredictable and idiosyncratic nature of L2 development, and (3) the importance of intra-individual variability. The first issue follows from the realization that studies on second language learning should focus on the system as a whole and self-organization. However, the question of language emergence is much less a focus of empirical studies, probably because a first language must by definition have been acquired before a second language can be acquired. For this reason, the “origin of language” question is much less a matter of debate in this field. The second and third issues (unpredictable and idiosyncratic development and variability) correspond to the focus on nonlinear forms of change.

Interacting variables in L2 acquisition

The issue of studying **interacting variables** is at the core of the underlying model of second language development. According to De Bot et al. (2007), much of the literature at the time considered simple causal models and implied a linear point of view. In contrast, De Bot, Verspoor and Lowie argue that complex interactions exists between different variables, such as the way the native language literacy is a crucial condition for the successful acquisition of a second language (see for instance Sparks and Ganschow, 1991). A systems viewpoint implies that all variables are interconnected and influence each other in complex ways (de Bot et al., 2007, p. 8), and this interconnectedness of subsystems has been a focus point of various studies.

For instance, Caspi (2010), Verspoor et al. (2008), Spoelman and Verspoor (2010), and van Dijk et al. (2011) have shown how subsystems develop at different rates with different trajectories. In the study of Caspi (2010), the trajectories of four L2 learners of English were analyzed and the results showed that the lexical system developed before the syntactic system, and that for each subsystem general use increased before accuracy was achieved. A more in-depth case-study showed that residual and moving correlation plots corroborated the existence of complex interactions between the knowledge levels, and cycles of competition and support between variables. In another study, Verspoor et al. (2008) analyzed an advanced English learner’s academic writing with regard to the development of vocabulary and complexity. Several interesting patterns were revealed, among which a competitive relationship between type-token ratio and sentence length, and a supportive relationship between finite verb ratio and noun phrase length. In Van Dijk et al. (2011) we also addressed these interrelations and reanalyzed the acquisition data from Cancino et al. (1978) which followed the emergence of the negative verb constructions in detail.

Though at the global level the development showed the expected sequence, interesting interactions at the microscopic level were observed. The first observation was that from the beginning onwards all four negative constructions occurred, and each construction seemed to develop in a wavelike form. The second observation was that nontarget-like constructions (that is constructions that are considered non-grammatical or uncommon) would keep occurring even after the increase of target-like constructions.

As a final example, Spoelman and Verspoor (2010) followed a Dutch learner’s acquisition of written Finnish over a 3-year period. Once again, the results showed interactions between variables over time, with the learner’s complexity variables sometimes competing and sometimes supporting each other. Interestingly, although accuracy and complexity seemed to be in competition early in the study period, they later changed to a noncompetitive relationship as the learner became more proficient, suggesting that proficiency level may influence the interaction of other variables.

Combined, these studies have provided evidence that in L2 development complex interactions most likely exist between different language variables and that these interactions become visible by investigating individual trajectories with a high measurement resolution.

Nonlinearity and variability in L2 acquisition

The second important issue for second language development is the question of whether there is a **fixed order** of acquisition which is identical for each learner. According to various authors, the notion of developmental sequences is a generally accepted finding in L2 research (Baten and Hakansson, 2015; Long, 2007; VanPatten and Williams, 2007), and this is supported by robust evidence over the past 40 years (see Abrahamsson, 2013; Meisel, 2013). In contrast, De Bot et al. (2007), have argued that there is no pre-determined order, but that development is unpredictable and idiosyncratic. This notion is supported by results from various empirical studies. For instance, Larsen-Freeman (2006) examined language production of five Chinese learners of English in a longitudinal study, by means of measures of written grammatical complexity, lexical complexity, accuracy, and fluency. Although

the group means indeed showed a linear increase, the patterns of the inter-individual and the individual data exhibited very clear differences, as the learners progressed and regressed in widely varying ways. Learners showed unique developmental pathways, with different rates of improvement and temporal decreases in some variables, findings which had initially been obscured by the use of group averages. A similar finding was also reported by [Verspoor et al. \(2008\)](#) in a study on academic writing development. Here, the learner showed development in almost all the aspects investigated. This progress was nonlinear and was different for each variable. In another study from this group on advanced writers' use of finite and nonfinite dependent clauses ([Verspoor et al., 2017](#)), there were only few similarities between the three learners. Instead, each learner had their own unique trajectory. The authors argue that although developmental stages may be observable in group means, the latter are not representative for any of the individuals. When investigating the L2 development of two identical twins, [Lowie et al. \(2017\)](#) found that in spite of the striking similarities between these learners in terms of background, proficiency and genetic make-up, the development of their L2 English over time was very different. Developmental patterns for spoken and written language even showed opposite tendencies. These observations underline the idiosyncratic nature of the process of second language development.

However, these results are not convincing for all L2 researchers. According to [Baten and Hakansson \(2015\)](#), the non-linearity that is revealed in the studies is the direct result of the way CAF measures are used to reflect L2 development. They consider this problematic because no rationale is provided for the use of these measures. Adopting a different type of criterion in their own study, –namely the first emergence of certain forms—the authors report that although the use of subordinate clauses is variable, the development of the internal structure followed a clear and constant sequence. They conclude that these findings are evidence that fixed developmental stages do exist in second language acquisition. However, dynamic systems approaches do not assume that fixed orders of development do not exist entirely. Some of these orders are simply unavoidable, because the steps or stages are defined in such a way that their order becomes a logical necessity. For instance, this is the case when a more advanced stage includes the qualities of the simpler stage, or because a stage of using a certain strategy is preceded by a stage in which this strategy is not used. In other cases, a different order is not impossible, but just very unlikely. For instance, though it may be possible that children start out by using three word utterances after which they start using one-word utterances, it is implausible because the universal aspects of the stages originate from the general principle of first simple, then more complex. Dynamic systems approaches are very well compatible with the assumption that such general principles exist. However, these approaches argue that when zooming in on individual trajectories, development is idiosyncratic and nonlinear. Combined, these results show that also in the study of second language acquisition, there is evidence for both a global order and unpredictability at the individual level of development.

The phenomenon of **intra-individual variability** is studied relatively frequently in second language acquisition research. For instance, [Polat and Kim \(2014\)](#) conducted a longitudinal case study on the development of complexity and accuracy for an advanced untutored learner of English. The data showed that most development occurred in the participant's lexical diversity, that syntactic complexity had only a slight improvement, and that accuracy did not change at all. Moreover, the trajectories were highly variable and there were temporal peaks in both lexical diversity and the number of errors. Several studies have shown that increased variability coincides with a developmental jump in second language development as well ([Spoelman and Verspoor, 2010](#); [van Dijk et al., 2011](#)). In addition, [Plat et al. \(2018\)](#) used spectral slope analysis on the data of 42 Dutch students in a Dutch/English naming task. A fractal (that is: self-similar) pattern of variability was found for both L1 Dutch and L2 English word naming. The results also suggest that automatic, optimal coordination of mental processes existed in L1 whereas this was much less the case for L2. This conclusion is in line with an earlier study of [Lowie et al. \(2014\)](#) that looked at a single native Dutch speaker who was very proficient in the L2. Here, the variability showed a more optimal ("fractal") pattern for the language that was recently used, regardless of it being the L1 or L2.

Finally, it is important to note that the coupled equation models that were used in the L1 development have also been applied to L2. One example is worked out in [Caspi \(2010\)](#), where vocabulary knowledge (receptive productive gap) and writing performance of four learners were fitted with the precursor models of [Van Geert \(1994\)](#). The optimization procedure showed a replication of the data trends on the basis of precursor interactions.

In sum, there is a general consensus among researchers that in L2 development, fixed orders of development exist while at the same time individual differences are large. Researchers differ in the interpretation of this paradoxical finding: whereas some argue that the underlying structure is fixed and variations only exist at the surface level, others argue that development is truly idiosyncratic due to processes of self-organization out of which various forms of order can emerge. Furthermore, also in the field of L2 development, it is highly likely that intra-individual variability plays a significant role in development. Finally, coupled equation models are also able to fit L2 development, as was also the case for L1 development.

General discussion

Summary

In this chapter, we have provided a description of dynamic systems theoretical approaches to language acquisition and of what they have yielded. As explained in the introduction, these approaches conceive of language acquisition as a complex system of interacting components or variables. In such a system, language emerges in a communicative context as a result of a process of self-organization. This theory has implications for research that are rather fundamental. Most importantly, it demands a focus on the system as a whole and the dynamic interactions between components and the environment, a radically different perspective on causality (process causality), and a renewed appreciation for intra-individual variability and nonlinear forms of change which

requires analyses of individual trajectories. Many researchers have been inspired by these approaches and have conducted empirical studies on first and second language acquisition. In most cases, the analyses are aimed at gathering proof-of-principle of the specific phenomenon under investigation.

With regard to the empirical literature on first language acquisition, various studies have been published that offer dynamic systems interpretations, and these have provided support for the existence of its main constructs. For instance, there is evidence that L1 development follows a non-linear pathway and that lexical and syntactical structures are likely to emerge through processes of self-organization at the micro-level (words, phonemes). In addition, several other dynamic aspects have been demonstrated to exist, such as reciprocal causality, discontinuities and changes in patterns of temporal variability. Together, the results show that first language acquisition is a highly idiosyncratic process that exhibits both continuity and discontinuity. Bidirectional interactions between variables and co-adaptation processes between children and caretakers have also been observed. Finally, relatively simple, coupled equation models have been successfully applied to trajectories of individual language learners. These models have also been validated and are shown to adequately predict individual pathways of language acquisition. With regard to research methodology, there are some studies that use or refer to empirical data with somewhat larger samples sizes (particularly experimental studies), but most use single or multiple case-studies with repeated measurement of rather global language variables. The data are predominantly on lexical or syntactic development (frequency measures) of children below the ages of 3 years.

Dynamic systems approaches to second language acquisition have addressed similar topics as in L1 acquisition: researchers have paid attention to non-linear shapes of change, have carefully described complex interactions between languages or language components and have conducted studies on the role of intra-individual variability. These studies have provided evidence for the existence of these dynamic phenomena in second language acquisition. Whereas for the field of first language acquisition, the topic of emergence as a result of self-organization has received ample attention, this is much less the case for the field of second language acquisition. In the latter case, the question of a universal fixed order of acquisition seems to be considered as more relevant. The studies so far suggest that based on the development of CAF measures, the existence of a universal fixed order is rather unlikely. Research on L2 development is in many ways explicitly inspired by L1 development. Therefore, it employs a similar methodology, such as multiple case studies, individual-based analyses, descriptive analyses, and modeling.

Critical reflection

In this contribution, we have used the term “dynamic systems approaches” without paying any attention to differences that exist between these approaches. However, it should be noted that there are several related theories and applications that can be considered as “dynamic systems approaches.” Among these are “nonlinear dynamic systems theory” (Thelen and Smith, 1994; Van Geert, 1994), “chaos theory” (Kelso, 1995), “theories of emergence” (Campbell, 2015), “dynamic network approach” (Schmittmann et al., 2013; Wichers, 2014), “dynamic field theory” (Spencer and Schöner, 2003), and “complexity theory” (De Bot, 2017). A description of the specifics of each of these branches goes beyond the scope of this chapter, but these approaches share the above described theoretical concepts, and differences are mainly seen in terminology, methodology and fields of application. The current contribution is based on the approach currently known as “complex dynamic systems,” which is the theoretical “branch” most frequently applied to the field of L1 and L2 acquisition (see for instance Van Geert and Verspoor, 2015; Larsen-Freeman and Cameron, 2008; Verspoor et al., 2004; Smit et al., 2021).

It is important to note that dynamic systems approaches are not standard practice of research into language acquisition at the moment. However, the framework is highly compatible with usage-based (constructivist) approaches, which are generally accepted in the study of Linguistics. Both approaches conceive of language and linguistic categories as emergent properties that come into existence through their use across contexts and where many elements and causal processes—such as statistical learning—come together. The framework also shares many conceptualizations with the theory of language emergence (MacWhinney, 1999). In fact, it may be argued that dynamic systems approaches provide an “umbrella” theory—an ontology—that functions as a modern working hypothesis of how to interpret reality, in the same way as Universal Grammar, Classical Test Theory and General Linear Theory are still prominent ontologies, based on very different assumptions than those of dynamic systems approaches.

If dynamic systems approaches are more of an ontology than a “regular theory,” one may wonder to what degree the claims that follow from it are falsifiable or not. If quantitative trajectories of language use—frequencies of the use of certain linguistic categories—are observed to be highly idiosyncratic, nonlinear and variable, what does this actually prove about the origin and mechanisms of language acquisition? Are the plentiful observations of highly idiosyncratic, nonlinear and variable trajectories of language use support for the idea of underlying universal latent constructs that develop linearly? Or do they support the nonlinear dynamics hypothesized by DST? And is the idea of underlying universal, latent, linearly developing linguistic categories compatible with the evidence for nonlinearity and complexity provided by such widely diverse fields as mathematics, physics or biology? These are fundamental, but difficult questions, and answering them requires an integration of theory and data, both from within and outside the fields of L1 and L2 acquisition.

In addition, many of the theoretical constructs from dynamic systems approaches actually lead to very specific testable hypothesis about developing behavior. This is particularly the case for the phenomena of intra-individual variability, linkages between layers of organization and time scales, and bidirectional influences between variables. Testing these hypotheses requires sufficiently dense data series and detailed analyses of micro development. For instance, if the prediction is that variability is meaningful, it can be hypothesized that it exhibits an optimal structure in certain circumstances. It can also be hypothesized that its amount and structure change in relation to other variables. Several attempts at testing the core theoretical constructs have been published, not only in

the field of L1 and L2 acquisition (e.g. Bassano and van Geert, 2007; Verspoor et al., 2017) but for instance also in the study of parent-child interactions (e.g. Yaden, 2003; Lichtwarck-Aschoff et al., 2012) and cognitive development (De Jonge-Hoekstra et al., 2020). If such hypotheses are not supported by empirical evidence, we would have no reason to still use the theory of complex dynamic systems as a general framework for empirical and theoretical studies.

A related criticism to dynamical systems approaches is that the descriptions of the system's behavior in terms of the nonlinear equations are taken as a mathematical description of its overt behavior rather than some underlying process, as Clark (1997: 115) noted (Clark, 1997). However, at the bottom of this problem is a matter of the ontology underlying the explanatory work. If the ontology is typically substance- or entity-oriented, the processual features of a particular temporal sequence must be explained by such an underlying entity, which is seen as the independent *cause* of the observable features. However, in a typical process ontology, the causal structure is one of process causality, where current manifest features of the process have causal influence on later features of the process (also see Van Geert, 2019). However, in a complex dynamic system framework, features on different but coupled levels of organization are co-dependent and typically display reciprocal causality.

Future directions

Ideas from dynamic systems approaches have been introduced more than a quarter of a century ago and have (rather slowly) seeped through in language acquisition research. At the moment, the validity of the main concepts has been demonstrated in many topics of first and second language development. This suggests that it is now time for larger scale dynamically oriented studies that address many of the unanswered questions about language acquisition. It may be argued that currently there is momentum for conducting such comprehensive empirical studies on first and language development. Traditionally, the study of language use and language interaction is a very labor-intensive enterprise. Currently, however, various new methods are being developed that can assist this process, for instance with (partly) automated data collection, transcription methods, and coding software for various languages. In addition, in recent years, many publications have appeared in related fields—such as psychology, sociology and pedagogics—that have employed dynamic approaches in larger scale studies to investigating various kinds of processes. These studies have conducted analyses of bidirectional influences, intra-individual variability, linkages between layers of organization and nonlinearity by means of new and advanced statistical techniques (such as latent growth curves and cluster analytic techniques). A promising direction in the field of language acquisition research is to investigate the ways in which some learners have different trajectories than others and in which ways typical and atypical language development show different dynamic properties over time. Employing a dynamic systems approach to studying interindividual differences offers a world of possibilities to ask and answer new and intriguing questions about language acquisition.

Writing before age three

It is well-established that, beginning about twelve months of age, many toddlers begin to make marks (Dunst and Gorman, 2009). They dip their fingers in food and delight in rubbing them across any surface they can reach (Matthews, 1999). By the time they are two years old, they are avid mark makers, whether they drag a stick in the dirt while playing outdoors or use pencils, markers, or paint brushes to leave their traces on paper. Though it is quite likely that these early mark-making experiences are in some way related to children's experiences in learning to write, the graphic activities of children under age three have attracted very little attention in the fields of literacy studies and literacy education (Dunst and Gorman, 2009; Lee, 2013). Instead, most of the research on the graphic activities of one and two-year-olds has been located in the art literature (e.g., Golomb, 1974; Kindler and Darras, 1994; Matthews, 1984) where researchers have been interested in the trajectory from early "scribbles" to iconic representations of people and objects, that is, childhood drawing.

Like art researchers, literacy researchers have generally associated children's earliest marks with drawing rather than writing, effectively pushing one- and two-year-olds to the margins of early writing research. When literacy researchers have attended to the mark-making of children under age three, the aim of research has often been to determine when children begin to purposefully differentiate their marks as writing versus drawing. While findings (Levin and Bus, 2003; Otake et al., 2017; Treiman and Yin, 2011) suggest that this differentiation begins, for some children, around age 2, only a small body of research has explored what children are learning prior to displaying writing-like features in their graphic products, or how they come to learn it (Dunst and Gorman, 2009; Lee, 2013). In short, we know much less than we should about how the graphic activities of one- and two-year-olds start them on a path toward the kinds of emergent writing (Teale and Sulzby, 1986) that have been so thoroughly studied and described for 3- to 5-year-olds. As Lancaster (2003) has argued,

It would be surprising if, from an apparent position of no serious engagement with print at all, children are suddenly able to explode into the type of rampant, creative, independent and reasoned relationship with the medium, which is described in... studies [of writing development of 3- to 5-year-olds.] It appears that much groundwork has been laid before. (p. xx)

My aim in this chapter is to draw together findings from my own studies of two-year-old writers to explore *what* children are learning about writing before age three, and *how* this learning happens, especially in preschool classrooms. In the next sections,

I first provide contextual information about the children who participated in my studies and the spaces where I and my research team observed them writing. Next, I provide a profile of what these two-year-olds were learning about writing. Finally, I describe the social processes through which these children were forming understandings about writing and coming to see themselves as writers. I conclude with some thoughts about why research on writing before age three is so important.

Contexts for observing two-year-olds learning to write

Writing and learning to write are local experiences. Like other aspects of early childhood learning (Rogoff et al., 1993) very young children's experiences with learning to write are necessarily shaped by their individual histories, the cultural expectations and practices of adult caregivers and teachers, and children's opportunities to observe and participate in writing events in home, caregiving, and community contexts.

The portraits of early writing presented in this chapter come from two, long-term qualitative studies of two-year-olds' writing in preschool classrooms. The eighteen children observed in the Walker Preschool study (Rowe, 2008a,b) hailed from White, middle class families, while the eighteen two-year-olds participating in the Write Start! study (Rowe, 2019; Rowe and Neitzel, 2010; Rowe and Wilson, 2015) were mostly from Black families living in a low-income neighborhood. All families lived in a mid-sized city in the United States and reported speaking English at home. Despite differences in children's racial and family backgrounds, formal and informal interviews with parents revealed many similarities in children's experiences with writing at home. In both studies, children had access to writing materials and paper at home, but neither group of parents asked their two-year-olds to write messages beyond the child's name. Some families in both studies limited children's access to pencils, markers, and other writing tools because they felt children were likely to "make a mess" by writing on objects or surfaces other than paper. Most children, in both studies, had opportunities to explore making marks on the page, and were sometimes given paper and pencil to pass the time while families waited for appointments, or helped older siblings with homework. Both groups of children had opportunities to see adults, siblings and others writing at home and in the community.

Most important for understanding the patterns to be reported in this chapter, both groups of children attended childcare settings where adults shared many similar ways of teaching and interacting with young children. The White and Black women who served as classroom teachers, along with me, as a White female researcher, enacted patterns of middle-class child-rearing (Mejía Arauz et al., 2005; Rogoff, 2003) learned in our homes, but also through early childhood teacher preparation. In both studies, teachers organized the day around long periods where children had opportunities to learn informally through self-selected play activities (Copple and Bredekamp, 2009). Adults invited and guided children's participation in play, engaging them as conversational and play partners.

Adults' interactions around writing were guided by emergent literacy principles (Rowe, 2008a). Specifically, each classroom devoted space to a writing center where children had open access to a variety of writing tools and media, and where they were encouraged to launch their own projects as part of child-selected play activities. Teachers wrote alongside children as a means of providing authentic demonstrations of what and how to write. They sometimes worked with children to co-author a text. While at the writing table, adults engaged children in extended conversations about their texts and topics related to their messages. Though none of the two-year-olds in either study were writing with conventional alphabet letters at the beginning of the school year, adults in both settings playfully invited children to write and asked them to read their marks. Regardless of the kinds of marks produced, adults accepted and praised children's participation as writers. Teachers assumed that "form follows function" and that participation in writing would, over time, lead children to construct new understandings about writing.

What does participation in writing look like before age three?

While research on children's earliest writing experiences in homes is limited, a few case studies conducted by parent researchers show that some toddlers begin to show interest in using writing tools to make marks beginning as early as 12–18 months of age (Baghban, 1984; Schickedanz, 1990). In these families, children showed early interest in observing and taking part in adults' writing. Sitting alongside an adult who was writing, youngsters grabbed the pen in a bid to make their own marks. When children were asked to write something, they took their turns by making marks. Initially, these very young children seemed to focus on the physical-motor activity of moving the pen across the page with little attention to the resulting scribbles (Baghban, 2007). However, within a few weeks or months, children began to play closer attention to their marks, deliberately repeating some kinds of movements and visually examining the outcomes (Schickedanz, 1990). Case study children were observed to start naming some of their marks as early as twenty-one months of age (Baghban, 1984).

My classroom-based research with two-year-olds (Rowe, 2008a,b, 2019; Rowe and Neitzel, 2010; Rowe and Wilson, 2015) provides additional insight into the ways very young children participate in writing events when they have open access to writing materials, opportunities to play with peers and the attention of interested adults. In the classrooms where these studies were conducted, children often voluntarily chose to come to the writing center. Two-year-olds were intrigued by exploring the physical properties and possibilities offered by paper and page-based tools for marking (pens, pencils, markers, crayons, rubber stamps), joining and affixing (stapling, taping, pasting), and disjoining (cutting, tearing, punching holes). For many, it was the physical process of marking or pasting or cutting that attracted their interest. Many children initially paid little attention to the resulting products once

they concluded their exploration of the tools. However, adults often opened conversations with children that drew attention to their texts. In response, children talked about what they were doing at the writing table in general terms or displayed their intentions non-verbally through pointing or other gestures. Children sometimes read a particular message for their texts.

Personal interests and approaches to participating in writing

While these findings establish that two-year-olds are interested in engaging with writing materials and interacting with others around their texts, our research (Rowe and Neitzel, 2010) also has shown that children's ways of participating in classroom writing activities varies in predictable ways related to their broader patterns of personal interest. Specifically, the types of writing activities children launched and the features of texts or interactions that drew their attention were related to more general orientations to play reflecting differences in preferred play types and actions. Our classroom observations identified four broad interest patterns.

Conceptual interests

Children with *conceptual* interests and play preferences spent a great deal of their play time in topic-centered explorations where they talked about, manipulated, and categorized themed toy collections (e.g., dinosaur figures, transportation toys) or other materials related to their conceptual interests. As they played, they sought out topic-relevant information or content knowledge related to these interests, often through requests for information directed at adults. These children approached writing as another kind of opportunity to draw, write, and talk with others about topics that were personally important. As they talked with adults and peers about messages for their texts, they often sub-contracted with adults to help them record their ideas. These children engaged in writing as a venue for developing and sharing ideas.

Procedural interests

Children who approached play with *procedural* interests spent the largest portion of their play in spatial-relational or constructive activities with materials such as puzzles or blocks. They preferred highly structured activities focused on the processes, uses or relations between objects. At the classroom writing center, children with procedural play interests were more likely to choose structured literacy materials and activities that moved them toward conventional writing. For example, at the writing table, these children engaged in repeated, self-initiated practice of letter and name writing using letter templates or name cards as models. Writing was centrally about performing conventional writing procedures and reproducing conventional print forms. Learning to write was a puzzle to be solved through careful observation and practice.

Creative interests

Children with *creative* play interests chose fantasy play and other activities that allowed them to explore and transform the uses of materials in novel ways. They preferred materials that could be used in multiple ways and were relatively free from inherent limits on activity imposed by structured materials such as puzzles. These children approached writing as an opportunity to explore the transformative potentials of open-ended writing materials and processes. They focused on generating innovative literacy structures and processes rather than reproducing them. They used materials in innovative ways and intentionally experimented with the properties of markers, paper, scissors and other tools while carefully observing the results. Interactions with other people played only a minor role in shaping their participation.

Social interests

In contrast, children with *social* interests regularly engaged in play actions aimed at building, managing, and maintaining relationships with their peers. They spent a large amount of time engaged in sociodramatic play where they took up roles related to their life experiences. (e.g., family roles, familiar occupations) and enacted social routines that focused on the relationships, rules, and structures of society. For these children, writing was experienced as an opportunity to be socially engaged with peers or teachers. These children tended to align their writing activities to those of other participants. For example, they joined peers with procedural interests in attempting to write alphabet letters and talked about the topics introduced by peers with conceptual interests. For these children, writing was an opportunity to initiate and maintain social connections with others. While texts were important, it was the social uses of those texts that were the focus of children's attention. For them, writing was a relational activity.

What are children under age three learning about writing?

Foundational understandings about writing

When the two-year-olds in our studies engaged in writing in emergent literacy classrooms they formed a broad range of foundational understandings about writing. These social contracts for writing (Rowe, 2008a) were socially shared understandings that allowed members of the preschool community to recognize and use written texts as a special class of material objects. These understandings were so basic that few adults would consciously recognize them as targets for instruction. For example, the children in our studies learned that pages containing their marks were viewed as a special kind of object and were central to mediating interactions with adults and peers. As children's attention was drawn more closely to the page and their marks, they formed foundational understandings about print as a representational system, including figure-ground relations (i.e., marks are the central focus in written texts

and paper is the background) and the message concept (i.e., the child's marks can represent a linguistic message, Clay, 1975). Children's attention was also drawn to the physical features of texts including the understanding that the edges of the page formed a physical boundary for the text and their marks.

Writing forms and directional patterns

Beyond these foundational understandings, children's marks showed that they were beginning to attend to the visual features of print (Rowe and Wilson, 2015). For adults, the writing forms produced by preschoolers can seem chaotic. However, emergent literacy researchers (e.g., Clay, 1975; Harste et al., 1984) long ago established that preschoolers' writing performances are not randomly produced, but instead provide clues to children's understandings about print.

In the Write Start! study (Rowe and Wilson, 2015), in addition to open-ended observations, we used a standard writing task where 2- to 5-year-olds were asked to write a caption for a photo showing them playing in the classroom. Data from this study provided an opportunity to cross-sectionally and longitudinally analyze the writing produced by 139 preschoolers including a group of 18 two-year-olds whose data patterns are the focus of this section. In all age groups, we found that variability was the rule, with two-year-old Write Start! study participants producing the types of writing forms seen in Fig. 1: undifferentiated scribbles, scribble units, stroke units, personal cursive and personal manuscript. Though none of the two-year-olds produced conventional letters when writing a photo caption, their writing forms, nevertheless, showed increasing awareness of print features.

Full page, undifferentiated scribbles were one of the most frequent types of writing for this age group and were produced by 28% of two-year-olds. These marks were visually the least print-like. However, by producing scribbles when asked to write, children demonstrated the foundational understanding that writing involved making marks.

The other forms of writing produced by two-year-olds showed the beginnings of more fine-grained awareness of what print looks like, beginning with global observations that print is organized into units and continuing with increasingly more complex observations of letter features. Twenty-eight percent of two-year-olds wrote using scribble units. Their texts contained many small patches of overlapping scribbles surrounded by white space. An additional 22% of this age group wrote using stroke units, generating texts composed of small individual lines, circles, or curves. These children wrote their messages with marks reflecting their observations of the kinds of strokes used to create English alphabet letters. A final group, 22% of two-year-olds, produced either personal cursive or personal manuscript. As seen in Fig. 1, personal cursive is characterized by wavy horizontal lines, and reflects children's attention to the linear arrangement of English print. Children who wrote with personal manuscript generated letter-like forms that contained at least two different kinds of strokes joined in the same unit. Personal manuscript demonstrated children's more developed understandings about the complexity and variation in strokes and how they are combined to create alphabet letters—an awareness that is also foundational to processing print during reading (Rumelhart, 2004).

Children's texts also showed that some were beginning to attend to the directional patterns used to arrange English print on the page. While the majority of two-year-olds in the Write Start! study produced overlapping scribbles (28%) or placed their marks in random locations on the page (44%), just over one fourth of the children (28%) arranged their marks in horizontal, vertical, or diagonal lines. As children moved from whole page scribbles to creating different kinds of marks surrounded by white space, some two-year-olds demonstrated emergent understandings of the linear arrangement of English print units.

Message content

While writing forms have received the most attention from researchers, as children in our studies talked about and read their texts to adults, they also demonstrated their developing abilities to verbalize the messages represented by their writing. Clay (1975) has argued that the message concept, the child's understanding that their own marks can represent a linguistic message, is a crucial understanding that must be formed by young writers. In the Write Start! study (Rowe and Wilson, 2015), after children had responded to the request to write a photo caption, we also asked them to read their writing. Analysis of children's orally produced messages provides a window into their initial understandings about the representational nature of print and also of the kinds of messages that might be expressed through print in a familiar social situation.

Write Start! assessment data showed that two-year-olds used several different strategies to structure their responses when asked to read the marks making up their photo captions. A first group, comprising 28% of two-year-olds, was silent or responded with gesture or mumbles. Our qualitative observations suggested that many of these children seemed unsure of what was being asked of them or how they were expected to respond.

When children were asked to read their writing, some two-year-olds took their turns in interaction by reading messages that were unrelated to the content of the photo, despite having previously talked with the adult about the pictured events and objects. Six percent of children used the opportunity to talk with the adult about an unrelated topic. These children used their developing conversational skills to successfully take their turn in response to an adult question but did not link their talk to the ongoing writing event. An additional 6% of children produced a conventional performance such as reciting the names of numbers or alphabet letters in sequence or reading a conventional message such as "I love you." While not related to the task of composing a photo caption, these children demonstrated understanding of specific kinds of messages they had experienced writing with adults at home or school.

In a third pattern, 22% of two-year-olds produced an oral message that was related to the immediate social or physical act of writing (e.g., "It's red."; "I went round and round." "It's for you." "I want to take it home."). They understood that reading their writing involved talking about the writing event underway.

The most frequent response for this age group was also the most conventional. Despite the unconventional emergent forms of writing produced by all two-year-olds in the Write Start! study, 39% of this age group read their marks as a word, phrase, or sentence related to the people, objects, and actions depicted in the photo. To read their marks, they drew on their ability to talk about familiar topics and ongoing events as a support for message construction.

Speech-print match

In addition, to learning how to compose a message for their written texts, children were also learning about the inner workings of print as a representational system. As Read (2009) has suggested, the understanding that written symbols can represent spoken language is an essential component of learning to write in alphabetic languages. This global understanding is a necessary foundation for forming the fine-grained understandings about speech-print match that underlie the alphabetic principle.

Our observations of children writing and reading their own texts also provided opportunities to examine children's earliest understandings of the ways a spoken message is related to print on the page. Of interest here are the emergent forms of speech-print matching produced by two-year-olds. In a recent reanalysis of data from the Write Start! study, our research team has examined how children linked gestures directed at the page with the rhythm of their spoken messages as evidence of their understandings of connections between their written marks and spoken messages. These analyses revealed that two-year-olds in the Write Start! Study ($n = 18$) used several different approaches to linking written and spoken messages.

First, about 6% of children were entirely silent when asked to read their marks and therefore provided no information about their understanding of speech-print matching. For these children, the request to read their writing was novel. Observations of embodied cues indicated that they did not fully understand what they were expected to do.

The most common pattern of speech-print matching for this age group, involved children's use of natural conversational speech to describe their writing, while using gesture to indicate the page as the target of attention. Seventy-one percent of children made these kinds of global connections between their spoken messages and the graphic array on the page. Specifically, children used natural, conversational speech to tell us about their texts, while also using gestures to globally point to the whole page (6%), point briefly to some marks on their page (53%), or to match the timing of the beginning and ending of their talk to the beginning and ending of their pointing (12%). Children using these approaches created global links between their oral messages and marks on the page. While there was no direct evidence that they understood that their marks represented speech, the act of talking about their writing while directing attention to the text set the stage for children's construction of more fine-grained observations about the way speech and print are linked in writing events.

Children using another approach also made global links between speech and print, but with an important change in their oral performance. These children (6% of the sample) began to use a slowed and segmented cadence for the orally produced message while continuing to point globally to the marks on the page. As children slowed and segmented their spoken message using an exaggerated rhythm, their talk no longer sounded like conversational speech. From this approach to speech-print matching, we can infer children were attending in a new way to the role of the spoken message in writing events—especially the ways they had observed adults slowing and segmenting their speech as they read their messages aloud during writing, or the ways adults slowed their reading as they pointed to print. Though there was no one-to-one match between speech units and print segments, these children demonstrated an awareness that the speech stream played a special role in writing.

In a final pattern observed for 18% of two-year-old Write Start! participants, young writers directly explored one-to-one matching of speech and print. These children slowed and segmented speech units (e.g., words, or phrases) and synchronized them to their production of marks during writing or to their pointing when reading already completed writing. As noted earlier, none of the two-year-olds in our study produced conventional letters in their photo captions, so this exploration of speech-print matching occurred as they produced other kinds of writing forms including scribble units, the up and down zigzags of personal cursive, and the individual letter-like forms of personal manuscript. Regardless of the graphic forms used, children displayed conscious awareness that it was the spoken message that was represented in writing and that writing involved matching specific chunks of speech to specific chunks of print.

These observations suggest that watershed insights like the understanding that writing represents a linguistic message that can be spoken aloud are not formed all at once, but instead have their roots in much more global understandings that children begin building as early as age two. Children's understandings of how speech is matched to print develop over time as they begin to talk about their writing and as they attend to the special ways of slowing and matching speech in adults' live demonstrations of writing and reading. Long before young writers begin to invent spellings with letter-sound correspondence, they begin to connect their developing phonological awareness with their observations about print features to explore how speech is matched to and represented by print on the page.

Writing identity

Implicit in these descriptions of what two-year-olds were learning about writing is the broader notion that children also were forming identities as writers. In the emergent literacy classrooms where we conducted our research, young children progressively came to see themselves as the kinds of persons who could actively participate in classroom writing events using their current forms of emergent writing to represent messages and read them to others (Rowe, 2008b). Evidence of their writerly identities is seen in children's eagerness to self-select writing activities as part of their play and to use writing as a form of social action. Over time, children became more active participants in the writing events of their preschool classrooms. While at first children demonstrated their identity as writers primarily by responding to adult requests that they write messages as part of play, over time they proactively took up roles as writers, generating their own purposes for writing and actively bidding for adult attention: "I'm gonna write you." or "I wrote you back!" While writing was collaboratively accomplished with adults, two-year-olds also exerted considerable agency by choosing which writing invitations to take up and by shaping their participation in writing in relation to their personal interests (Rowe and Neitzel, 2010).

Summing up: what children learn about writing before age three

Given opportunities to take part in emergent writing events, children under age three actively explore the graphic potentials of writing tools and surfaces. While at first this is primarily a physical-motor exercise, through interaction with adults, they come to understand that the resulting marks and texts have special significance in their classroom and at home. As they participate in joint writing with adults, they come to see themselves as writers and their texts as writing. As their attention is drawn to their marks and to the writing of adults, they make progressively more refined observations about the visual features of print. Their developing understandings are visible in unconventional writing forms that start as undifferentiated scribbles but soon contain small individual units and combinations of print-like strokes. As adults inquire about the meaning of these texts, children learn to respond by reading their marks as messages that are generally and then more specifically related to the ongoing social event. In these writing interactions, children begin to form global understandings that their marks and spoken messages are somehow related, and some children start to specifically explore the match between speech and the marks they make on the page.

Overall, two-year-olds who have opportunities to observe and participate in writing events, begin to turn their attention to both the social and technical aspects of writing. When looking at individual children's trajectories over time, our data (Rowe and Wilson, 2015) show that children move from global to more specific and conventional understanding for all features of print over time, though not all aspects are equally well-developed at any time point. As two-year-olds, children already show variability in their understandings about different aspects of print and in the pacing of learning. Variability is the rule rather than the exception.

How do children learn to write before age three?

As noted in the introduction to this chapter, there is no universal process for learning to write. Instead, what and how children learn is shaped by the writing practices of their larger communities. For young children, learning to write is further shaped by culturally based patterns of childrearing and guided participation (Morelli et al., 2003; Rogoff, 2003) that include adults' perceptions of their roles as caregivers and teachers, their cultural models for child development, their preferred arrangements for childhood activities, and the nature of adult-child communication.

The observations of young writers reported in this chapter occurred in preschool settings where teachers and researchers engaged two-year-olds in playful interactions involving writing as a means of supporting their literacy learning. Children were invited into learning-to-write events to watch and participate alongside more experienced adult writers. They were encouraged to playfully participate as writers using their current graphic strategies, regardless of their conventionality. Adults provided demonstrations

Fig. 2 Reagan's photo page.

of how writing should be done by writing collaboratively with children as part of play activities and by offering occasional bits of direct teaching in the context of the child's writing. Very little of this interaction looked like formal school lessons. Instead, as teachers intended, it looked and felt like play.

But the question remains: *How* do children begin to learn to write in these kinds of writing events? When an adult asks a two-year-old to write about a photo and then to read their marks, as we did in the Write Start! study (Rowe and Wilson, 2015), how do children learn what it means to "write"? What resources do they call on to participate the first time this request is made, and then thereafter? How do they learn to produce graphic responses that are increasingly more print-like? How do they learn to initiate writing interactions and use their texts to mediate social interactions?

To provide some context for considering these questions, in the follow section I provide a transcript from the Write Start! study recording the first time I asked two-year-old Reagan (a pseudonym) to write in his preschool class. In this early fall event, I first demonstrated making a page for a class photo book and then invited him to make his own page. Specifically, I asked him to write his name and a caption for a photo showing him building with wooden blocks in his classroom—an event that had occurred the day before. Fig. 2 shows Reagan's completed photo page.

Reagan's first invitation to write a message

1.	Rowe:	I point to the white space above Reagan's photo. "First, write your name up here. Write Reagan up on top just like I did. I wrote. 'Ms. Debbie'."
2.	Reagan:	Marks on his torso in the photo. "There!"
3.	Rowe:	"Yeah, you wrote on top of the picture." I point to the white space above the photo a second time. "Can you write up here? Write your name?" Reagan moves the paper closer to his body but doesn't respond.
4.	Rowe:	I tap the photo several times. "What do you think you should write about this picture?"
5.	Reagan:	Reagan reaches across the table for my photo page and lays it in his own workspace. He makes some marks on top of my photo. "You!"
6.	Rowe:	I laugh. "You wrote on top of me, too, didn't you?" I take my page and put it away. I once again slide Reagan's page into his workspace.
7.	Rowe:	"Ok! Down here!" I point to the white space below the photo. "Reagan, let's write something about your picture."
8.	Reagan:	Reagan is already adding more marks on top of the part of the photo showing his body. "My hair!"

(Continued)

9.	Rowe:	"That was your hair!" I point again to the space below the photo. "Can you write down here, I am playing with blocks?" I point to the blocks in the photo.
10.	Reegan:	Reegan begins to use the marker to make marks directly on the skin of his face.
11.	Rowe:	I gently move the hand holding the marker away from his face. "Don't write on your real face. We'll have to scrub it off!"
12.	Reegan:	"Yeah, yeah! You get a wupping!"
13.	Rowe:	"We don't want to get a wupping and we don't want to write on your face." I tap the page several times for emphasis. "Paper. Paper. We write on paper!"
14.	Reegan:	Reegan acts out washing his face by rubbing his hand over the mark and making a pretend washing sound "Shu Shu." He returns to drawing on top of the photo.
15.	Rowe:	"Alright! Now write your name up here." I draw my finger left to right in the white space above the photo. "So, we'll know, will remember, whose picture that is."
16.	Reegan:	Reegan draws a large circle around the entire photo. When his marker runs of one edge of the page onto the table, he is concerned: "Oh! Oh!"
17.	Rowe:	"That's OK. We'll wipe it off. This table is washable."
18.	Reegan:	"It's washable," he says, then continues drawing large circles around the photo.
19.	Rowe:	I touch his last circle. "Read that to me. What did you write there?"
20.	Reegan:	"Reegan write!," he says with excitement.
21.	Rowe:	I repeat his message: 'Reegan write.' "Good for you!" I tap the part of the photo showing his head. "Yep, right on top of your face, you sure did write on it."
22.	Rowe:	"Write down here for me." I touch the white space below the photo. "Write 'I am playing with blocks'"
23.	Reegan:	Reegan makes more marks on the part of the photo where his face is pictured.
24.	Rowe:	"Can you do that?"
25.	Reegan:	Reegan continues to make more marks on the photo.
26.	Rowe:	"Alright!" I take the page and begin to write below the photo, saying the words aloud as I write. "Let's put, 'I ... am ... playing ... with ... blocks'"
27.	Reegan:	He has paused and is watching me write. As soon as I complete the printed sentence, he begins drawing on top of his photo again.
28.	Reegan:	Reegan turns from the table and calls across the room to his friends. "Look! Look! Da Reegan! Everybody know Reegan!" He sits back with satisfaction and begins to make more marks on the photo.

Using what is "at hand" to participate in writing events

Though being asked to write was initially a novel request for the two-year-olds in our studies, children had at hand a variety of physical and social experiences to support their initial participation as writers. For example, based on his previous physical explorations of writing tools and mark making, at Turns 2, 5, and 8, we see Reegan confidently picking up a marker and beginning to mark on his photo page and mine. At Turns 12 and 16, his talk and actions reference social rules for using markers learned in previous experiences outside school that might be glossed as "write on paper, not your skin or the furniture." Though an adult would have expected him to write in the white space of the page, the target for his marks was the photo itself, where he proceeded to color on top of the regions of the photo showing his body. When I directed him to write "right up here" at Turn 15 and dragged my finger across the white space, Reegan complied by shifting his marks (mostly) to the white space, this time making large circles that roughly traced the boundaries of the photo—the topic of our conversation. When I suggested a message for his photo caption ("I am playing with blocks.") at Turn 22 and pointed to white space below the page, he returned to marking on top of the part of the photo showing his face. Finally, based on his experience in other events where he and his peers had enjoyed looking at photos taken in the classroom, at Turn 28 he used his photo page as an occasion to loudly bid for the attention of his classmates as they played in other parts of the room.

This example demonstrates that young children do not start with a blank slate even when they first respond to invitations to write. Instead, they use their existing understandings of social routines and events to support their participation. In the example, Reegan drew on at least two kinds of familiar events: exploratory "art" events where he and peers used markers and paper, and events where he and peers viewed and talked about photos of themselves and classmates. These familiar social routines provided Reegan with skills needed to take his turn in this writing event by talking about his photo, making marks on paper, and using his photo page to launch social interaction with his peers.

Though Reegan's graphic product had few, if any, print-like features, the marks were not random. Instead, they built on his ability to communicate with gesture. He directed his marks to the part of the photo that was relevant to our conversation—his body and the building blocks. When he moved his marker into the white space, he used it to inscribe the boundaries of the photo—the focus of our joint attention in this event. Like many two-year-olds in our studies (Rowe, 2019), Reegan's initial writing responses piggybacked on both his ability to make marks and to physically point to objects of joint attention. As Vygotsky (1978, 1997) and Luria (1998) noted, children's first forays into writing often involve the production of marks that are created

by pointing with a pen in hand. In this way, children like Reegan used inscribed gestures, literally pointing to the page with a pen, to graphically participate in writing at a time when they were just beginning to form understandings about print forms and processes (Rowe, 2019). Much like the role of pointing in oral language learning (Butterworth, 2003), these pointing marks launched children into writing by providing an initial strategy for meaningful graphic participation.

Adult demonstrations of what, how, and why to write

The event recorded in the example is also typical of the many opportunities that children had to write with and alongside adults. In these events, children's texts were foregrounded as an important focus for conversation and joint social action, drawing children's attention to the social importance given to writing products in their classroom. When adults invited children to write (Turn 4: "What do you think you should write about this picture?") or asked them to read their writing (Turn 19: "Read that to me. What did you write there?") they implicitly named children as writers and their texts as writing. These interactions also provided children with information about the roles, text types, and textual intentions adults viewed as appropriate for two-year-old writers.

While adult-child talk has received the most attention from literacy researchers, my interactions with Reegan demonstrate the importance of gesture and other embodied cues in these writing events. In the transcript, almost every turn used gesture or handling objects as cues to meaning and expected activity. Adults used gesture directed at the page to provide physical demonstrations of expected locations for print (Turns 1, 3), the linear arrangement of marks, and left-to-right directional patterns (Turn 15). Adults also provided implicit demonstrations of speech-print matching as they slowed and synchronized pointing and speech while reading their writing (Turn 26).

Because writing generated lasting graphic traces of adult and child activity, texts could be revisited and examined visually, verbally, and physically through gaze, conversation, and pointing. Child and adult texts served as sites for publicly negotiating writing content, processes, and purposes. As seen in my interactions with Reegan, it was at these moments that adults sometimes provided direct teaching about how writing works within the context of the ongoing shared activity. For example, after Reegan produced several unconventional responses to my request to write a message about the photo, at Turn 9 and again at Turn 22, I suggested a specific message that would be seen as an appropriate photo caption. These kinds of adult responses offered individualized, context-specific information about expected message content, writing processes, or social purposes for writing. In shared writing activities, children had socially supported opportunities to begin learning how writing functions to represent meaning.

Top-down and bottom-up processing in shared activities with common goals

Microanalysis of preschool writing events showed that learning to write was supported by the same social mechanisms that support language learning more generally. Tomasello (1992, 2008; Tomasello et al., 2007) has argued that communication, whether through pointing or speech, is built on the same foundational infrastructure, namely prosocial motivations for sharing with and helping others and the ability to establish joint attention with others inside shared activities with common goals. Bruner (1986) has further shown that for young children, most language is learned through joint participation with adults in familiar activities and collaborative routines that are part of everyday life. Our analyses suggest that these observations also hold true for learning to write.

Children in our studies learned to participate and to form shared goals in learning-to-write events through the use of top-down processing. That is, children used their understandings of the meaning and purpose of the shared activity to infer the likely meaning of the adult partner's talk, gestures, and actions. In the transcript at Turn 19, I touched the large circles Reegan had drawn around the photo and asked him to read his marks. Though this was a new kind of request, he used his understanding of our shared book-making activity to respond, "Reegan write!" Similarly, adults used their understanding of the shared activity to predict what young children were likely to mean, even if their talk and graphic activity were emergent and unconventional (e.g., Turns 7–9). Preschoolers and their partners made heavy use of deictic gestures to communicate their intentions, so adults and children actively attended to cues provided by the partner's gestures (Goldin-Meadow, 2014). Participants followed the direction of the other person's pointing to determine their partner's attentional focus. This allowed them to determine the meaning of their partner's gesture in relation to the jointly constructed shared common ground, that is "everything we both know (and know that we both know...)" (Tomasello, 2008, p. 75) about the ongoing activity.

Additionally, participants in these face-to-face interactions closely tracked cues to their partner's intentions provided by handling and placing objects, body posture and movement in space (Andr n, 2010; Tulbert and Goodwin, 2011). Through top-down processes, children learned the meaning of the unfamiliar words and novel requests produced by adults in learning-to-write events. Through bottom-up processing (Tomasello, 2008), children also learned that when an adult used a new bit of language or pointed to an object, they were being invited to share the adult's attentional focus; that is, they should notice what the adult was attending to as a means of understanding the meaning of the unfamiliar oral language, print, or gesture. In this way, children began to attend to and notice meaningful patterns in the visual features, message content, and social functions of the graphic arrays produced in shared writing activities.

Summing up: how children learn to write before age three

As Vygotsky (1978) pointed out, writing development does not happen all at once. Instead, it occurs as “the result of a long series of developmental events” (p. 57). Children, like Reagan, do not immediately understand that print stands for language when an adult first suggests a message and demonstrates how to record it with print. Instead, over time, children form increasingly more sophisticated understandings about print through many small moments of social interaction around writing.

When children produce marks in events culturally framed as writing, the resulting graphic array becomes a public site for adult-child negotiations of the semiotic properties of the child’s marks (cf. Goodwin, 2003). Children’s texts provide opportunities for adults to reframe children’s marks as if they were symbolic representations of linguistic messages. Through these interactions, adults provide individually tailored demonstrations of the content, processes, and purposes of writing.

Despite the powerful roles of adults in preschool writing events, learning to write occurs as a collaborative activity in which children exert considerable agency. They choose which suggestions for writing interactions they will take up and perform them in ways that are in line with their current understandings of writing. Children frequently renegotiate or ignore adult suggestions and invitations in favor of writing that is more in line with their own personal interests (Rowe, 2008b; Rowe and Neitzel, 2010).

For the two-year-olds in our studies, learning to write was not accomplished individually, but instead in joint interaction as adults and children acted and reacted to one another around writing. In writing events, children used both bottom-up and top-down processing to learn about the content, processes, and purposes for the kinds of writing used in their classroom community. Children learned to write through peripheral and gradually more central participation in play-based writing events (Lave and Wenger, 1991).

Concluding thoughts

In this chapter, my goal has been to describe two-year-olds’ participation in emergent writing events, what their texts looked like, and what they were beginning to learn about print and themselves as writers. The data clearly show that these youngsters began to form foundational understandings about writing through observation and playful interactions with adults. Against the backdrop of these findings, a colleague in another field once asked me, why should we care about writing for children this young? As he put it, “Can’t writing wait until they are older?” As I conclude this chapter, I offer three reasons why research on writing under age three is important.

First, children living in literate societies are immersed in writing events in the normal course of everyday life. Children aren’t willing to wait! Writing is part of their sociomaterial environment and they explore it even if there is no intentional effort by adults to engage them as writers. A case in point was provided by a parent who showed me her checkbook where her preschool son had used neat rows of personal cursive to fill in all the blank lines on the paper checks he found in his mother’s purse! While these childlike forays into writing are amusing, they also establish that very early on, children feel the social press to learn about and participate in writing because it is an important part of their experiences at home and in the community. Children under age three commonly see their siblings sitting at the table doing homework or a parent jotting items on a grocery list. Children have natural curiosity and motivation to participate in these kinds of everyday routines. Given the importance of learning to read and write in later schooling, these early forays into writing are learning opportunities that are too good to miss!

Second, research on children’s writing before age three can help adults recognize and value the very beginnings of writing as seen in children’s unconventional texts. This is important because it has implications for the ways adults interact with young children around writing. Adults often overlook the power of one- and two-year-olds as creative and active literacy learners because their participation in writing events is so unconventional. Faced with a page of scribbles, adults are more likely to ask children, “What did you draw?” than asking them “What did you write?” –even if the social occasion is one in which writing is foregrounded. Though the present chapter provides an initial portrait of two-year-olds’ writing responses, much more research is needed to understand how this age group and even younger children begin to learn to write in different kinds of social situations, and with different kinds of adult supports. We need to better understand the normal variability in the ways that children approach writing.

Third, research on children’s earliest playful experiences with writing provides clues to the social and material conditions that support their participation as writers. This is important information for parents and early childhood educators whose understandings and values largely shape the writing opportunities and kinds of adult supports that children are offered. For very young children, learning to write occurs in play and everyday activities rather than in formal lessons. In our studies, adults invited children to write for purposes that made “human sense” (Donaldson, 1978) in relation to their play and the social scene, accepted and responded with interest to children’s texts and talk regardless of conventionality, asked children to read their marks, and found many ways to celebrate and value children’s participation in writing. Adults intentionally wrote collaboratively or alongside children and looked for opportunities to provide quick bits of individualized instruction tailored to the child’s current writing project. While these kinds of interactions fit well with current notions of developmentally appropriate preschool learning environments (Copple and Bredekamp, 2009), there is still much to learn about the ways that parents and early childhood teachers can invite children into writing at home and school.

To better understand the beginnings of writing, in the future, researchers will need to collaborate across theoretical lines to study learning-to-write as a both a sociocultural and cognitive enterprise. Single perspective studies, while helpful, will always fall short of understanding the complex interactions between cultural, social, and cognitive facets of learning to write in early childhood. To

move the field forward, future research needs to simultaneously ask and answer questions about cultural practices around writing in early childhood, writing identity, ways of collaborating in face-to-face interactions, and children's sociocognitive strategies for learning about writing.

This is a paper about children's earliest attempts to make writing their own. Learning how to write and read is an integral part of language development, it is not an added skill. There is no aspect of language use—from storytelling to understanding metaphors, from colloquial to academic usages—that remains untouched by literacy and, conversely language development has a crucial impact on developing literacy (Tolchinsky and Berman, in press).

Nonetheless, studies that have examined spelling and reading from a developmental viewpoint typically identify a developmental phase in which children do not associate the graphic signs of writing with language. This phase has been called: pre-communicative, pre-phonetic, pre-phonological (e.g., Ehri, 1995; Gentry, 2000; Winch et al., 2010; Zhang and Treiman, 2015) with children in this period generally being labeled as "pre-literate" (Gombert and Fayol, 1992).

This chapter examines the key features of this "pre" phase, in particular how children single out writing as a particular type of notational system, and what representational status they attribute to writing if not to represent language. As will become clear, I am reluctant to refer to children in this phase as pre-literate, on the grounds that literacy begins to develop even before children can read and write using littera "alphabetic letters."

It is not easy to pinpoint the precise age range of this pre-phase. On the one hand, the fluctuating nature of development is particularly salient during early childhood (Dawson-Tunik et al., 2005). On the other, the variability between learners is huge even in controlled teaching environments with a shared curriculum (Campbell et al., 2019). The fluctuating nature and inter-subject variability in the domain are exacerbated when one compares findings from different languages (English, Hebrew, Spanish), periods in history (from the 1930s to the present day) and contexts (e.g., at school, in the laboratory, at home), as I plan to do in what follows.

In literate communities, the first social act takes a written form since a child "shall be registered immediately after birth".¹ In such environments, children grow up surrounded by different types of notations (road signs, advertisements, commercial labels), they are exposed to letters on T-shirts and stickers; letters of the alphabet are named in songs and poems. And in many countries, letters are taught even in nursery schools, where children are expected to be able to recite part of the alphabet, to recognize letters as part of their own name (declaring "that's me!"), even learning to draw letters. If they are lucky enough, young children also participate in family practices of the kind that Lareau (2000) called concerted cultivation. But even such children have not yet discovered that alphabetic writing represents the sound dimension of language.

My purpose in this chapter is thus to clarify what comes in development before writing is phoneticized. Given that exposure to notational input and participation in literacy practices is a key condition for developing literacy, here I address two related questions: first, what information do children extract from the notational environment and, second, what meaning do they attribute to such information?

The chapter is organized as follows. It starts with a brief summary discussion of the sources that underlie the pre-phonological phase of literacy, the sensorimotor roots of conceptual development, and the neurological underpinnings of the initial disconnection between the visual material provided by writing and the language children talk. This is followed by a short historical account of the germs of writing to highlight both the sensorimotor/manipulative its origin and the role of users' interpretation in linking visual markings to language. The second part of the chapter illustrates basic action schema that children mobilize to obtain a desired

¹Article 49 Article 7 1 the UN Rights of the Child (September 1990).

outcome from literacy related artifacts like cellphone screens and books and implements for writing like pencils or crayons. And I consider the kind of information children extract from the printed environment by applying learning mechanisms that enable them to identify graphic regularities. The third part of the chapter focuses on children's attribution of meaning to writing before they realize that writing represents the sound properties of spoken utterances. I conclude with some reflection on the nature of developing literacy, the inborn capacities that it entails and its reliance on explicit teaching.

The pre-phonological roots of literacy

Sensory motor roots

Like any other domain of knowledge, literacy is rooted in early sensorimotor experience that are crucial for the development of later cognitive skills and abilities. As explained by [Wellsby and Pexman \(2014\)](#), sensorimotor experience refers to "a range of experiences that typically involve an action being performed on an object, either by a child directly, or through observation of another's actions. The experience is multisensory, derived primarily from visual, tactile, and proprioceptive senses" (p. 9). This quite broad characterization of sensorimotor experience in the form of actions performed on specific objects is more precisely defined in earlier works, such as Piagetian epistemology, Bruner's account of the "attainment of competence" in small children, and the notion of "affordance" of James and Eleanor Gibson. These three perspectives guide my interpretation of the earliest literacy development, as supported by current neurobiological accounts of conceptual development that also involves other systems such as emotions (e.g., [Pulvermuller, 2013](#)).

Neurobiological underpinning

Nothing in our evolution prepares us to receive language through the eyes. Nonetheless, current brain-imaging techniques show that literate adults possess highly evolved mechanisms adapted to reading which show up in brain areas that are activated during reading. [Dehaene \(2009\)](#) defines literacy as a case of neuronal recycling because the same neural mechanisms and brain region that are found in the macaque species of monkeys are those relied on in human reading. The mechanisms that genetically enable object discrimination are recycled to be able to carry out the necessary discriminations required for reading. Learning to read would be a remarkable instance of brain plasticity.

Studies applying neuroimaging techniques specify that the shape of letters is recognized in the occipito-temporal region in the left hemisphere, and that this information is transmitted to diverse areas of the left hemisphere that are in charge of attributing sense, sonority, and articulation to written characters. In other words, learning to read consists in connecting the visual with the linguistic areas of the brain. These interconnections are bidirectional from visual to linguistic areas and vice versa.

On the other hand, and a finding crucial to our topic, recent research on the growing connections between visual and language regions observed in children in the process of learning to read shows that the activation of the left hemisphere observed in adults did not occur in children who still had not learned to read. The latter, instead, revealed activation in the right hemisphere with no link between visual forms and language. Research did, however, note activation of the neural networks associated with reading among children from the age of 7 years. By this time, the area attending to the visual form of words is already distinguished in the left occipito-temporal region as well as in temporal regions ([Dehaene, 2009](#)). [Shaywitz and Shaywitz \(2008\)](#), who conducted one of the few longitudinal studies in this domain, show that reading improves the activation of this region, and that this increase depends more on reading level than on chronological age, suggesting that this level of activation does not in itself reflect brain maturation. Linking visual information to language, activating language while looking at written displays is a consequence rather than a prerequisite for learning to read. Thus, the interest in inquiring into the meaning children attribute to written displays before they establish its link to language. From the perspective of both evolving cognition and neurological underpinnings, we assume that developing literacy builds on sensorimotor experience. Moreover, it is likely that, alphabetic writing follows a comparable historical evolution.

Historical grounding

Historically, the precursors of writing were collections of clay tokens or counters of various geometrical forms: spheres, discs, cones, and tetrahedrons devised to show number and quality of merchandise for trading, to know, say, how many sheep, or how many crops are for sale. This system of artifacts was used by ancient Sumerians living in what is now southern Iraq from the ninth millennium BCE onwards (e.g., [Schmandt-Besserat, 1998](#)). The forms representing the animals or products were not figurative but rather arbitrary symbols that differentiated kind on the basis of height, size, or form. The system was very secure, but each time recounting or checking of merchandise had to be undertaken, the bullae had to be broken. The solution to this problem can be considered "the great invention": People started to mark the outside of the clay bull, when still wet, so as to indicate what was inside. The impressions on the bullae were signs of the tokens inside them, which in turn were signs of the counted items. They were "second order signs," signs of signs. When tokens were used for recording, they could be directly manipulated to control the transaction. But the impressions on the bullae could not be manipulated for checking the amount of merchandise; they had to be interpreted. Thus, these second-order signs enabled (and demanded) a new activity: Interpretation by thinking or by saying something. It is in the interpretation of these impressions that the link to language was established ([Coulmas, 1989](#)). The (verbal) interpretation of the

marks by the traders and a process of abstraction of these marks led to the emergence of the cuneiform writing system many centuries later (around 3500 BCE). Only then did the marks on clay allude to language leading to the expansion of writing as a system for representing language. This is clearly an oversimplified account of the historical emergence of writing. Yet it is worth considering because it points to the reasons that led to the emergence and subsequent evolution of writing, and to a direction of development that goes from the manipulation of physical objects via the creation of physical marks (that provide visual information) to an interpretation that made it possible to link the marks to language.

Initial research approaches

Research interest in pre-phonological features of literacy acquisition originated in the late 1930s, with the work of Luria and Vygotsky on “the prehistory of written language” (Luria, 1929/1978). Almost 50 years later, this interest was renewed in three different languages and cultures. In English, it followed, initially, an ethnographic, sociocultural approach in what is termed “emergent literacy.” Even children who have not yet started formal instruction in literacy are asked to compose phone messages, food-recipes, birthday cards, letters to the parents, and so on. The different categories and stages of early writing are obtained from observing how kindergartners and preschoolers plan, write and read back different types of texts (e.g., Clay, 2001; Dyson, 1987; Goodman, 1980; Sulzby, 1986). In Spanish, it arose in the pioneering work of Ferreiro (Ferreiro and Teberosky, 1979/1982; Ferreiro, 1986a, 1994) with the aim of tracing “the psychogenesis of written language.” This line of work expanded to other Romance languages such as Italian and Portuguese in different Latin American and European countries. Studies were carried out using relatively structured clinical interviews following Piagetian methodology. Children from 3 to 6 years of age were asked to sort written materials, to match pictures to written labels, to create blanks in written sentences as well as to write words, sentences, and stories. Investigators observed both the graphic characteristics of the written products and the verbal explanations given by children while writing and after having written. Their aim to discover what children know about the writing system, their knowledge of the function and social uses of writing. A third line of work, in Hebrew, addressed similar issues, but applying a more controlled methodology (Tolchinsky Landsmann and Levin, 1987; Levin and Tolchinsky Landsmann, 1989). As we note next, many of the findings elicited applying mainly qualitative methodologies were later replicated using more controlled paradigms, larger samples, and careful analytical procedures.

Children's mobilization of “action schemas”

Foundational schemas

While I was considering how to approach the sensorimotor schemas on which literacy builds, I recalled a scene I witnessed a few months ago at a supermarket. A young mother was queuing for the cashier with a small child, maybe 20–22 months, on a baby trolley. Seeing how long the line was, she searched in her bag and took out a colored children's book about penguins. The little boy took the book in his hands and started to bang/tap on the penguin's face. Realizing that nothing happened, he gazed incredulously at his mother, who immediately responded by instructing her child: *así no “not like that!”*, *ábrelo y pasa las páginas “(you) open it and turn the pages.”* I was enchanted by the scene, although friends of mine, parents of small children, did not find anything particularly remarkable. They took it for granted that tapping on a tablet is an established schema for a young child.

In 2015, data from (non-representative) samples of the American population suggest that children's access to mobile technology may be approaching saturation; 96.6% of children under 4 reportedly have used mobile devices at home. This trend is not exclusive to American children. Estimates from other industrialized countries similarly indicate that toddlers and preschoolers are introduced to mobile technology at an early age, with many now using touchscreens daily (Kabali et al., 2005).

The scene at the supermarket illustrates how an action schema, as a sequence of actions afforded by a given object which had been successful to attain a goal is intentionally mobilized to obtain a similar goal afforded by similar object. The scene serves to exemplify what Bruner described, long ago, as the “attainment of competence” in infants, and also the notion of “affordance” advanced by the Gibsons. As Bruner put it, “In the growth of such competence in infants, three themes are central: intention, feedback, and the patterns of action that mediate between them” (Bruner, 1973, p. 1), a description that underlined the intentional and anticipatory nature of an action. Exploratory activity, even at a very early age, is controlled by some anticipation of an outcome, presumably an adaptive one. These ideas have strong implications for literacy development.

Should children be exposed to books—as carriers of texts—that require other actions to obtain a desired outcome and guided by a well-disposed adult (such as the mother in the supermarket scene who had the time and patience to explain to her child what to do), they will include a book-reading schema in their repertoire and apply one or the other when appropriate taking control of the differing action-schemas called for.

Snow and Ninio (1986) carried out a series of studies addressing a similar question, by observing mother-infant dyads in the process of picture book reading. They concluded that from 8 to 18 months of age children “the child had progressed from an attempt to eat the page to being able to participate fully in verbal dialogue” when looking at the book (p. 116). Children grasp the physical actions involved in reading—gazing, pointing, monitoring—and also become familiar with the verbal behavior afforded by books (Bus et al., 1995). This engagement is critical for children learning to link graphic information to language.

Similar findings were obtained from Spanish-speaking toddlers. At the age of two, children believe that they must look at the pictures in order to discover the story, but within a few months, they start to make distinctions between text and pictures (Ferreiro,

1986a). They give each a different name and state that the text and not the pictures must be read, “because there are letters.” That is, children realize that books are a particular kind of object—different from food, toys, pets or people—an object you look at and say something in a loud voice. They also realize that different information is extracted from pictures than from the accompanying letters.

Well before the invention of mobile technology, Gibson and Yonas (1966) demonstrated a similar intentional and anticipatory nature in small children's control of graphic production. They assumed that “The marking of traces, controlling of the displayed trace, and the seeing of these new display variables were assumed to motivate the act of scribbling, not the transient feedback from the activity itself” (Gibson and Yonas, p. 155). Children from 15 to 38 months were presented with paper, a tool that left a trace and another that did not. The researchers provide a vivid account of infants' discovering “a fundamental graphic act” (Gibson, 1988) when given the tool that left a trace. When handed the nontracing tool, their scribbling was significantly reduced and then abandoned.

Small children raised in isolated communities have an internal representation of writing—to write means the production of marks on paper—but reading has no definite meaning, it is confused with writing (Ferreiro, 1986a,b). For example, children who had just jotted down some marks on a sheet of paper and were then asked to read them back responded that they had already done so. Other children claimed that pencils were needed for reading. Such comments are not a simple matter of terminology, they indicate, rather, that the nature of writing is understood at an earlier age because it leaves visible traces; it changes the object visibly, while reading does not.

This insight was summed up several decades ago Gibson and Levin (1975), “For the human species, at least, the marking of nonpictorial graphs is nevertheless interesting and has a genetic development which seems to be to some extent self-directed” (p. 231). This has been shown by several studies in different languages, as we explain below.

Sensitivity to orthographic patterns

Small children develop increasing responsiveness to the orthographic patterns of the written language they are exposed to prior to learning to read conventionally. This responsiveness might build on learning mechanisms that enable the extraction of statistical patterns in auditory and visual input. The effect of such mechanisms is well recognized for early language acquisition where studies show, for example, that infants develop early sensitivity to phonotactic patterns in their native language. Phonotactic constraints define what sound sequences are possible and which are not, based on attention to what sequences do and do not occur in the ambient language (Estes et al., 2011; Mattys et al., 1999). Along similar lines, 8-month-old infants were exposed to sequences of discrete visual stimuli whose ordering followed a statistically predictable pattern. Subsequently they were again shown the familiar pattern but alternating with a novel sequence of identical stimulus components. Researchers found that infants exhibited significantly greater interest in the novel sequence at all ages, indicating that they discriminate between known and unknown visual patterns (Kirkham et al., 2002). Similar discrimination and selection abilities were found by pre-phonological children in different sorting tasks.

Children apply readability criteria for distinguishing possible from impossible combinations of letters in their language. The mere presence of letters is not enough for something to be readable. Over a period of several decades, researchers applied similar tasks using different instruction to children acquiring different languages and orthographies (English, Hebrew, Italian and Spanish). Pre-readers (aged 2–5 years) were shown cards containing graphic displays differing by several variables: iconicity, familiarity, number, and variety of graphic elements. Whether children were asked to separate “writing from non-writing” (Lavine, 1977) or to say “what is good for reading from what is not” (Ferreiro and Teberosky, 1979/1982) the conclusions were similar. Cards displaying drawings were the earliest to be rejected as words or as possible to read. Then, letters from unknown alphabets, mixed alphabets, and cards containing only one sign or more than 10 in a row were increasingly rejected as children grew older, but before they were able to read. Kaefer (2016) had 3–5-year-olds to distinguish words from non-words when faced with strings of letters, non-letters, and numbers. Three-year-olds do not distinguish between them overtly, but they do look significantly longer at a number or a symbol. In contrast, 5-year-olds identified strings of letters as “words” and strings of non-letters or repeated letters as “non-words.”

Pre-readers were also able to distinguish between sequences of letters that are possible combinations in their language and those that are not. Children rejected strings containing repeated vowels or repeated consonants demonstrating their understanding that a word must integrate both types of letter (Pick et al., 1978). In order to decide which combinations are “well written,” they look both at the letters that are integrated within the string and at the general configuration of the string (Ferreiro, 1982). The ideal written word—the graphic display that was better accepted as good for reading—contained more than 2 and less than 6 letters from own alphabet.

The constraints that children impose on number and variety of signs in order for a graphic display to be readable are not mere inventions: They attend to the actual distribution of word length and intra-word variation found in real texts of the different orthographies that were tested. Neither Spanish nor English has written words containing the same letter repeated in a row more than twice consecutively (e.g., acceso “entrance”). In line with children's constraints, the rules of English spelling outlaw triple letters while in Hebrew this constraint applies to consecutive strings of three identical consonants.

Notably, the constraints on number and variety are applied only to writing and not to numbers. Together with Annette Karmiloff-Smith we asked Spanish speaking children to separate between cards they think “are good for reading” from those that “are good for counting” (after piloting we have found that this expression is the most frequently used by Spanish small children to design

numbers). Cards containing one graphic sign or several repeated in a row were rejected as good for reading but accepted as good for counting (Tolchinsky Landsmann and Karmiloff Smith, 1992).

These intuitive criteria of a word's readability are evident in children's sorting as well as in writing tasks. This is important, since if a text is readable, it makes sense for a person (in this case a young child) to wonder what it means, whereas if it is not readable, there would be no point in pondering its meaning.

Early writing patterns

In a different study Annette Karmiloff Smith asked preliterate and "predrawing" children that neither know how to read nor how to draw in a conventional manner—to draw a dog and write its name (Karmiloff-Smith, 1992). Children felt rather bewildered when asked to write since they clearly believed that they were not supposed to know. As suggested by Brenneman et al. (1996), this refusal might reflect a child's conviction that writing, as opposed to drawing, requires special marks that must be known. Once convinced to try, their drawing typically appeared as circular scribbles while their writing as wiggly horizontal lines. Yet, even when their drawings were hard to distinguish from their writings, close observation showed differences in the production process. When pretending to write toddlers, lift the pen much more frequently than when pretending to draw. Drawing appears as a much more continuous movement than writing. By 4 years of age, children have learned about the formal properties that differentiate drawing from writing, although it may take them longer to learn how each system is used to refer and communicate. These findings were confirmed by Brenneman et al. (1996) with 4–6-year-old US children who were asked to draw and write various targets. Children were more likely to make linear productions while writing than while drawing. Gombert and Fayol (1992) reported similar findings with 3–6-year-old French children. They were more likely to make productions containing linear, segmented units created in the left to right direction when writing than when drawing.

More recently Treiman and associates confirmed similar distinctions among even younger Chinese (Treiman and Yin, 2011) and US children (Otake et al., 2017). Both Chinese and US 2–5-year-olds had to write and draw the words for fire, sun, water, and their name and to draw these same targets and a picture of themselves in the drawing task. In both tasks, children were given a choice of five implements (black pencil, black pen, red crayon, yellow crayon, blue crayon), and four types of paper (grid paper and unlined white, yellow, and pink paper). Even the 2-year-olds in these studies made some distinctions between writing and drawing. Children in the youngest group (mean age 2;8) created smaller writings than drawings and their writing tended to be more rectangular than their drawings. When writing, for example, participants were more likely to use dark implements and to choose grid paper, which Chinese schoolchildren use to practice writing characters. Moreover, adults who were asked to classify the productions as writing or drawing performed significantly above the level of chance with the productions of 2-year-olds.

From a very early age, children are sensitive to some of the formal properties of different notational systems. It would appear, moreover, that this sensitivity is not limited to children from a specific culture and/or language.

There are vivid documentations of the transition from unbroken, wavy scribble produced by 2-year-olds to the tracing of separate marks (Schickedanz and Casbergue, 2004; Vukelich and Christie, 2009). As children grow older their writing will increasingly display the superordinate/formal features common to all writing systems: They are linear, go in a certain direction, have discrete units, and are not iconic. Children tend to arrange their scribbles horizontally, revealing a growing correspondence between their attempts to write and the directionality of their orthography (Brenneman et al., 1996; Pontecorvo, 1985; Sulzby, 1986). Puranik and Lonigan (2011) provide support for such a developmental trend in a study with over 300 English-speaking children aged 3–5 years. All 3-year-olds in the sample had acquired most of the superordinate writing features, while specific-language features could only be found in the writing samples of 4- and 5-year olds.

In examining word-writing among Spanish- and Hebrew-speaking children from preschool through second grade (Tolchinsky and Teberosky, 1998), we found that the written products of preschoolers in both languages were constrained by the same formal features of number and variety: Every string contained a similar amount of letters (between 3 and 5), and adjacent letters were not repeated. These initial similarities subsequently diverged increasingly between Spanish and Israeli children, as the distinctive features of each language began to have an effect (in this case, the primary role of consonants in a Semitic script).

These studies in different orthographies confirm the salience of the visual/formal patterns of writing, which children extract from the print they encounter in their environment rather than due to a direct instructional strategy. Adults might teach letters, how to write proper names and real words, but not to scribble in ways that look like writing but are not.

Multiple studies in different languages, showed that, for representing their own names, children use more advanced writing forms than when writing other words. The same children might use letters or simile letters for their own name and produce unspecific, unbroken, wavy scribbles for any other word. A recent study showed that among all the tested predictors, including gender, age, and number of years in the program, only name-writing ability (assessed at school entry) predicted early writing scores after 6 months (Campbell et al., 2019).

During the period in which children's writing display the superordinate/formal features common to all writing systems they produce very similar patterns for different words and even different sentences. They did not introduce graphic indications of differences in meaning. One crucial characteristic of written displays is that they can be interpreted outside the context of production—separated from the person who has produced them. But if no graphic distinction is made, only someone who has produced or been asked to produce them is able to interpret it. At this stage of writing development, the product has not yet been detached from the process of production and from the producer. Children behave as though the place where writing stands (e.g., under a certain picture) or the writer him or herself, rather than any particular feature of the written display, will determine the

interpretation (Tolchinsky, 2003). A study by Yaden and Tardibuono (2004) with Latino preschoolers illustrates clearly that a child's first attempts to differentiate writing outcome is in terms of his or her intents. In spite of producing very similar outputs for different words—the same arrangement of the letters of his or her own name—s/he is certain that they are different. After this period of “undifferentiated” writing (Ferreiro, 1982), children gradually become more selective as to what forms or combinations of forms are accepted as writable. As a consequence, their own written production becomes more constrained and children introduce graphic indicators to reflect differences in the words they are attempting to write.

The study of Yaden and Tardibuono (2004) again provides a clear illustration of this important development. They found that a child named Alfredo, in spite of using a limited number of simile letters (forms that resemble letters but are not) in different orientations, varied these symbols in order to distinguish words (nene “child” and oso “bear”) and the names of family members. Researchers report this type of “recombinatory strategy” (the same symbols in different combinations) as being used by several children at this stage of writing.

These findings suggest that children are aware that differentiating between written outcomes must take place when creating the message rather than when interpreting it, since only then can the written outcome be understood as an entity in itself, separated from the producer and the context of production. When asked to read what they have just written, children usually repeat verbatim the words they have been asked to write, pointing globally at the entire piece of graphic material or at an unspecified part of it. The question arises, however, what meaning children attribute to the visible/graphic changes they observe and produce in writing.

Meaning attribution and written language

Early attribution of meaning

We have seen how small children are able to discriminate between pictorial and written displays, initially attending to their distinctive formal constraints and later on to some of their orthography-specific features. The early graphic patterns children produce and identify as writing are not yet symbolic patterns. They are action-schemas in the graphic space, but they are not interpretable by other, they do not contain cues to what they stand for. Even when children introduce graphic changes in their constrained productions in order to write different words and to map a verbal utterance (a single word or multiword expression) onto what they have written, when they pretend to read the product, it is clear that they have not yet disclosed how writing means.

Nearly a 100 years ago, in 1929, Luria addressed this issue by asking 3–7-year old children to write a list of expressions in a way “they could remember.” The productions of the youngest did not contain any graphic cue to the phrases the children had to remember. But at some point, some of the older children began to introduce certain graphic elements as clues to the meaning of the written phrases. For example, they use longer lines for “The monkey has a long tail” than for writing “It's cold in winter.” Luria called this “pictographic” use of written sign because they try to represent the content of the utterance rather than its sounds.

Ferreiro (1985) reported similar findings. Children explained, for example, that oso “bear” should have more letters than pato “duck” because a bear is bigger than a duck. She remarked, however, that differences in shape or color of the referents were not reflected in children's writing. Later on, Iris Levin and I (Levin and Tolchinsky Landsmann, 1989) had Hebrew-speaking preschoolers to write pairs of words that represented objects differentiated by shape (e.g., ball/rope) color (e.g., tomato/cucumber) and size (e.g., elephant/ant). We controlled for word length so that the longer sounding word refer to the smaller object (pil “elephant”/nemala “ant”) while the words referring to shape were of similar length. We found that the use of shape and color was very rare and tended to decrease with age while the use of more symbols for bigger objects tended to increase. Prereading children favored the use of number of symbols over any other referential resource.

Children's attempts to establish a direct relation between writing and physical features of the referent was also found in their judgments of written displays. Bialystok (1991) showed English-speaking children two pictures accompanied by two printed words, which the investigator read out loud, and then had the children match each picture with the word they thought they had just heard. The test items manifested two different relations between pictures and words, one of correspondence between the length of the word in number of letters and the size of the object in the picture (e.g., ball and ballerina) and the other one of non-correspondence between them (e.g., cat and caterpillar). Non-readers gave correct responses more often for corresponding than noncorresponding pairs, suggesting that they used the relative sizes of objects to make decisions about the number of letters in printed words. A previous study by Lundberg and Torneus (1978) drew similar conclusions for Swedish-speaking children, who were presented word pairs both orally and visually and asked to indicate which printed word went with each spoken word. Four-to seven-year-old non-readers gave more correct responses when the relative lengths of the words were consistent with the relative sizes of the referents than when the two were not consistent.

In order to further prove whether children's initial attribution of meaning is guided by the referential content of the utterances they are attempting to write rather than by phonological considerations, Zhang and Treiman (2015) presented children with words said out loud one at a time without accompanying pictures, so avoiding additional cues that might make semantic information particularly salient. These researchers applied a rigorous procedure to identify pre-phonological spellers' insights. They asked children to write words that varied in number of phonemes (from 3 to 9) and size of the object (e.g., ant, asparagus, bear, beetle, bug, bus). For each writing production, they measured the area of the smallest rectangle enclosing the entire production (in cm²) and found that object area had a significant effect on area of writing production. Pre-phonological spellers took up larger areas for words representing large objects than for small objects while producing writing of similar size for words with different numbers of

phonemes or syllables. They applied similar analyses with number of written elements as the outcome variable and found that neither number of phonemes nor number of syllables significantly predicted number of written elements.

Zhang and Treiman study added convincing evidence regarding the existence of a phase in developing literacy during which children do not conceive writing as related to speech, whether segmented by phonemes or syllables. Children can produce graphic displays that look like writing and are recognized by external observers as such because they obey formal constraints of writing, in many cases containing letters, however they relate the size and number of elements in writing to the size of the entities the words refer to.

These consistent findings raise a number of queries. Does this behavior indicate that children are resorting to a drawing resource in their writing? Are they confusing the way drawing and writing represent meaning, so contradicting earlier claims about differentiation between the two notational systems? Or is this, rather, an indication of the representational status writing has at this point in development? In other words, does this notational behavior indicate what writing represents for children at this developmental period? What do they think needs to be noted? How should writing resources be used to note what they think should be noted?

Several studies (Ferreiro, 1986b; Olson, 1996; Olson and Homer, 1996) have addressed these questions creatively. They designed writing tasks in which, if children assume that writing represents meaning directly, there would be a contradiction between writing (leaving marks on paper) and the meaning of the utterance they are asked to write. If, on the other hand, children relate writing to the linguistic expression that it manifests, no such contradiction should exist.

This was examined in different ways. For example, negation is amply represented in oral language and, children produce and understand negative statements from an early age, yet studies show that the written representation of negative statements constitute a genuine difficulty for children. Ferreiro (1986b) conducted individual interviews with a group of pre-reading Spanish-speaking children, where the investigator wrote, in front of the child, sentence such as: *Mama compró tres tacos* "Mommy bought three tacos," then read it out loud and asked the child to repeat what was written. Immediately afterward the child had to write the negative version of what s/he had heard, *Mama no compró tacos* "Mommy didn't buy tacos" with the written sentence still visible in front of him/her. Ferreiro reported that one-third (34%) of the children alluded to the impossibility of writing the negative sentences. She explains this as due to children's being unable to overcome the apparent contradiction between marking something on paper and the absence connoted by negation. Following the same methodology, Ferreiro reported that 53% of the same children refused to write the sentence *Ningún pájaro vuela* "No bird is flying" after the sentence *Un pájaro vuela* "A bird is flying." In this case it was the due to the absence connoted by the negative quantifier.

Olson and Homer (1996) and Olson (1996) tackled similar issues with English-speaking prereaders and illiterate adults. Participants were presented with simple written texts which were then read aloud to them. For example, they were shown a card on which was printed *Three little pigs*, and the investigator read the text out loud, pointing to each word in turn. The child then repeated the text. Following this, the final word in the written sentence was covered, so that only some of the words remained exposed (*Three little*) and children were asked what they thought was written there. A common response was to say: *two pigs*. When a further word was covered, children tended to read it as *one pig*. Olson and Homer concluded that children take the marks as tokens for things rather than as signs for words.

In a second study, they asked pre-reading children to write such statements as *One cat*, *Two cats*, *Red cat*, and the like. Children showed a similar pattern of responses: They tried to make their writing (scribbles or simile letters) correspond to the number of cats that were mentioned. Finally, when the child was asked to write *No cats*, the researcher reported that the child glanced at the adult and waved her pencil above the paper without leaving a mark, and without prompting said: "There's no cats so I didn't write anything."

Although these studies were designed to test prereaders' assumption of a direct link between the written marks and "the things" mentioned in the utterances, there are other possible interpretations for these responses that might shed light on the processes involved. This behavior can be interpreted as children's search for semantic congruence. In other words, children may be attempting to relate to the meaning of the expression/utterance rather than to the things it refers to; that is, they do associate writing with language, but not to how it sounds, its phonology, but rather to its meaning (its semantic content). This alternative interpretation highlights a possible lack of the required metalinguistic ability on the part of pre-readers to separate content from form. What are the implications of the two interpretations of pre-reading?

In the cases just described (e.g., mapping between number or size of written elements and size of the referred entity, refusing to leave marks on paper because there are no entities in the statement they are supposed to write) children are creating a visual similarity between the symbol and the symbolized. Since 1932, when John Ridley Stroop discovered that it is easier to say the color of a word if it matches the semantic content of the word (saying the word "green" if it is written in green ink rather than blue or red), the "interaction between objects as referents and their symbols (words)", is recognized as a well-known famous (and intriguing) effect of perception on conceptualization (for a review see Shen et al., 2016).

In literate adults, visual congruence between symbols and what they symbolize facilitates processing, words are recognized and interpreted faster. Congruence might also function as a feasible strategy for pre-reading children to match successfully each word with its picture (as shown in different studies by Bialystok, by Lundberg, and Torneus) studies, and may serve help them to cope with the writing task—especially when the application of such strategy is facilitated by the way the task is presented. To test the effect of (in)congruence, stimuli are presented as pairs of words that contrast on a specific dimension of content (size, color, quantity) and allowed to choose between different colored crayons so they can take advantage of an obvious resource for writing (change in number or size of graphic elements). It is more difficult, however, to use this strategy to explain children's refusal to produce marks for representing absence or negation, as in the studies of Olson and Holmes.

An alternative account views these behaviors as a consequence of a metalinguistic deficit in young children, which impedes their ability to dissociate the referent from features of the utterance. Although preschool children use negation pragmatically to mark agreements and disagreements with speakers' assertions, they do not conceive of negation metalinguistically to make judgments about statements (Hummer et al., 1993). Metalinguistic awareness is not a dichotomous ability that children either do or do not have. Rather, it follows a protracted progression that starts very early in little children's self-repairs when speaking and grows into the ability to think about and discuss different features of the language people know or are in the process of learning. This lack of a highly evolved metalinguistic capacity is thought to be responsible for children's difficulty in representing negation in writing. Such a metalinguistic deficit is reflected, for example, in young children's difficulty in understanding synonymy and homonymy, as tasks that require to distinguish between the linguistic expression and what it represents Doherty (2000).

Against an interpretation in terms of metalinguistic deficit, Olson argues that representing negation is equally difficult for pre-reading children and non-literate adults, thus, it cannot be seen as a developmental phenomenon which will be overcome with age. The fact that this behavior is overcome after learning to write supports Olson's view that writing brings the structures of language into consciousness and not the other way around. Negation is a linguistic device which speakers use competently. But without a representation of negation in writing, negation is not readily brought into consciousness and turned into an object of thought. As explained by Olson (1997), when writing offers a visual model for the representation of language, the negative particle comes to be represented by a distinctive sign for that negation, as in the written word *not*. Similarly, for the representation of absence, "nothing becomes a something which can then be examined, thought about, and operated on." (p. 14). Put it more simply, pre-readers and illiterate adults have a struggle with the representation of negation and absence because they have not yet learned to read and write, because they have not yet acquired a system for representing language.

Conclusion

Writing and language

Young toddlers before age two may emit sounds that mimic reading when they look at a story-book; they imitate adult's behavior in front of a text. This "simile-reading," applied to their own scribbling or to other printed objects, is crucially important because it links a verbal behavior to a written object. Adult cues may also guide children in linking writing to language. Parents of young children tend to talk about speaking and writing in quite similar ways.² For example, a parent may use the word *say* to refer to both speech and writing (e.g., What did you say? What does that sign say?). The words *name* and *word* can also be used interchangeably to refer to units of the written or spoken language (e.g., I just wrote my name or that's not a nice word to use). According to Robins and Treiman (2010), the use of similar terms to refer to both speech and writing may help children to realize that the two systems symbolize language.

The phoneticization of writing constitutes a genuine turning point in developing literacy. It implies that what is said can be written, that different words reflect more than referential differences such as size, amount or color. True, this assertion is an oversimplification: We cannot represent in (alphabetic) writing differences between, say, a Texan and New York accent, or the length of the pauses that people produce when speaking, one of the reasons why children find it difficult to separate between words in writing. Writing is not a code for transcribing speech but a system of representation of language or, as advanced by Olson (1996), a model of language in which certain features are represented and others are not.

Detailed description of the process of phoneticization or how children acquire the alphabetic principle that each graphic element stands for a phonological segment is beyond the scope of the present chapter. This process is well-documented in the literature on developing literacy (Byrne, 1996; Tolchinsky, 2003). Rather, I wish to underscore, in line with Olson, that metalinguistic awareness is significantly extended as a consequence of literacy learning. The blossoming of language awareness with literacy contrasts markedly with the widely accepted view of language awareness as a prerequisite for acquiring literacy.

On the nature of literacy development

Text-books and encyclopedias caution that reading and writing are achieved only by explicit instruction (Malmkjær (1993/2010). Yet the picture we have depicted so far of the abilities of prereading children point to several developments that do not result from direct teaching. Children build action schema afforded by literacy-related artifacts and implements which become richer and more diversified with the availability of new artifacts and cooperating adults. Children extract relevant information from the notational environment, they are sensitive to its regularities and rely on this sensitivity to develop incipient orthographic knowledge. Pre-readers are also able to take advantage of cues provided by written forms—number and size of elements—to reflect their own ideas on the representational status of writing, regardless of whether they turn out to be mistaken. The quality of exposure to and interaction with potential teachers are conditions for early literacy acquisition while formal instruction is fundamental for developing proficient writers and readers, but this is equally the case for every domain of knowledge. The quality of input and interaction

²They conducted a series of analyses using CHILDES, a database containing child language transcripts from numerous different researchers. They included all the transcripts of parent-child conversations in English, mostly in the U.S., with children between 18 months and 5 years of age. Although the transcripts were collected by different researchers for a variety of purposes, they found that parents speak about writing with their children even when they are quite young.

conditions early language development whereas formal instruction is necessary for developing proficient and reflective users of language, although some gifted individuals may get to it by intuition if not by instruction (Tolchinsky and Berman, *in press*).

We have been told time and again that reading and writing abilities, unlike speaking or breathing, are not natural (Emig, 1977; Stanovich, 1994), that the human brain is naturally wired to speak, whereas our brain needs to follow a systematic instructional process in learning to read and write. To the extent that natural means “genetically specified,” I would argue that developing literacy is as natural as speaking: both are enabled by the basic human capacity for learning. The ability to learn language(s) and writing (and many other things) is wired into the human brain (Dehaene, 2019). “The great majority of the brain’s development happens after we are born. It matures as much as possible in the womb, but this still leaves the lion’s share of developmental work to be done after birth. The upside to this state of affairs is that our brains are finished being built while they are immersed in a particular culture, allowing our brains to be fine-tuned to operate in that specific environment” (Lieberman, 2013, p. 41). If we take these assertions seriously, as more and more evidence from neurobiology suggests we should, we have no choice but to recognize and embrace the enormous importance of early socio-cultural experiences from the environment for early as well as later learning to read and write.

Introduction

In this chapter, we regard biliteracy as a creative strength and as an integrated linguistic repertoire that bilingual speakers own instead of two separated language systems (Hornberger, 1989; Reyes, 2012). Examining biliteracy through a creative performative lens (Medina and Campano, 2006; Medina et al., 2014)—where language, identity and culture are understood as dynamically interacting and co-constructed—we first discuss the emerging, inventive, and creative features of biliteracy to foreground the skills emergent bilingual children create and engaged within multiple social domains. Second, we focus on research that highlights bilingual and biliterate performative practices in a multicultural and pluralistic world. Specifically, we dive into depth of how family, cultural, and linguistic playfulness are enacted in everyday practices. Next, we review biliteracy pedagogical performative practices in drama and play with the aim to discuss new goals and challenges of promoting biliteracy from a creative and playful space in schools that honors emergence, creativity, linguistic hybridity and plurality as productive spaces for learning.

Creativity in and across languages

In countries such as the United States, from where the culturally diverse—China, USA, Puerto Rico—multilingual group of authors of this chapter do most of our work, monolingualism ideology, which regards two languages that bilingual speakers own as two separate systems, has been accepted as a dominant view in language and literacy programs in the K-12 settings (Cummings, 2000; Wiley, 2014). Within such programs, it is commonly seen that one language is legitimated according to the time, space, policies, and instruction (Farr and Song, 2011; Ruiz, 1984). The claim of many of these programs is to “help” emergent bilingual speakers, who oftentimes are labeled as English Language Learners (for a critique of this term, see Martínez, 2018), develop their English proficiency and learn school-like literacy (Morrow, 1995) or academic language (García and Solorza, 2020) so that they are able to catch up with the English monolingual peers in terms of achievement in content areas (Hornberger, 1989). These forms of language education approaches, grounded in orientations of language as a problem (Ruiz, 1984) however, might result in the suppression of bilingual students’ bilinguality in school (Cummings, 2000; Li and Wu, 2009) and the construction of material and ideological barriers through segregation and erasure approaches with consequences in relation to students’ rights to “exist in their own language” (Perryman-Clark et al., 2014).

Moll (2014) perceived biliteracy as a “tool of the intellect” (p. 84), which is used by bilingual speakers for facilitating their dynamic discourses and practices. The visible differences (e.g., English and Spanish) are merely the surface feature of languages (Cummins, 1980; Reyes, 2012); beneath the surface, two languages do not work separately. Bilingual speakers think in, between, and beyond two languages when practicing in the complex, multi-layered, and interrelated multilingual communication (García and Sylvan, 2011; Li, 2011; Perez and Torres-Guzmán, 1992; Reyes, 2012). They creatively use languages in order to express and negotiate complex meanings (Franquiz and de la Luz Reyes, 1998; Gutiérrez et al., 1999; Medina, 2006; Medina 2010). Instead of perceiving bilingual students as deficient English speakers, educators need to consider the development of ways of doing with biliteracy in classrooms that honors the creativity, fluidity, and complexity of linguistic plurality as assets to support students learning (Canagarajah, 2011; García and Lin, 2017; Guerra, 2016; Perryman-Clark et al., 2014).

In order to dig into the complexities of linguistic pluralism, its creative nature, and its potential in the development of creative biliteracy pedagogies, it is important to value what Blommaert (2010) stated, “[m]ovement of people across space is never a move

across empty spaces” (p. 6) and advocate for pedagogical practices that value the creative and improvisational practices in classrooms (Canagarajah, 2011).

García and Li (2017) described Canagarajah’s work, “translingual practices focus on the social practices of mixing modes and symbol systems as a creative improvisation to adapt to the needs of the context and the local situations” (pp. 122–123). Bilingual speakers’ communicative patterns and language practices are drawn from their linguistic repertoire, which is socially, culturally, and historically constructed (García, 2011; Smith, 2019). The requirement of speaking one language only or “standard” English in school ignores the dynamic and creative feature of bilingualism (García and Solorza, 2020). In fact, drawing on knowledge from their entire linguistic repertoire, bilingual students have an opportunity to deploy their full capacities in learning (Baker, 2011; García, 2011).

In Bauer et al. (2020) research, students in an English-Spanish dual language program purposefully used codes from two languages to communicate and ensure their understanding. Creese and Blackledge (2010) argued that code-switching implemented by educators as a resource in their classroom contributed to students’ identity performance, confidence, and academic achievement. Similarly, Canagarajah’s (2013) work promoted hybrid forms of writing consisting of dominant genre conventions as well as multilingual and diverse language resources. Findings suggested this hybrid form was beneficial for both multilingual students and native speakers of English when the students were in a space where both language experiences were equally valued, disrupting a common notion that multilingual students are deficient.

Bilingual speakers creatively use their entire linguistic repertoire to form communities of practice (Lave and Wenger, 1991) and engage in negotiated literacy during which they share textual conventions, strategies, and semiotic symbols and signs in order to communicate. Hornberger (2005) suggests, “bi/multilinguals’ learning is maximized when [bilingual speakers] are allowed and enabled to draw from across all their existing language skills (in two+ languages), rather than being constrained and inhibited from doing so by monolingual instructional assumptions and practices” (p. 607). Using in and between two languages is not a problem but a strategic, expressive identity and meaning-making process (Gutiérrez et al., 1999; Franquiz and de la Luz Reyes, 1998; García, 2011; Gort, 2008; Gutiérrez et al., 1999; Palmer et al., 2014) as well as a form of linguistic access, agency and equity in discursive learning spaces (Blommaert, 2010; Smith, 2019). Ignoring or stigmatizing alternative uses of English may stymie students from developing an accurate comprehension of language use (Matsuda, 2001) and undermine the “creativity that arises from belonging to multiple communities” (de Saint-Georges, 2013, p. 3). Educators are urged to value it as a legitimate public practice and recognize bilingual students’ creativity in literacy practices (Zhang and Guo, 2017).

Creativity in everyday biliteracy practices

Languages that bilingual speakers own are always localized, always dynamic, and always evolving (Blommaert, 2010; Pennycook, 2010; Shohamy, 2006). In this section, we reviewed and listed articles addressing how biliteracy is practiced as a creative and powerful ‘tool’ by bilingual speakers to have social existence in classrooms and access to a wider range of resources.

Identity development & translanguaging

Bilingual students’ identities are shaped profoundly by their literacy experiences (Jiménez, 2000; Smith, 2019). Their sense of belonging increases as their languages and identities are accepted, used, and valued and the classroom legitimizes the way bilingual students perform their own constructed identities through translanguaging (de Jong et al., 2020). Kabuto’s (2013) investigation distinctly highlighted the importance of teachers providing openings for children to maintain their identities. In this longitudinal observation, an emergent bilingual with the kindergarten teacher who was aware of the child’s biliterate capacities demonstrated her meaning-making process in complex and varied ways. On the other hand, with the first-grade teacher who was not aware of the child’s biliteracy and therefore did not encourage, the young girl’s own perception shifted to exhibit more monolingual modes of discourse versus bilingual.

Sayer’s (2013) work discussed Spanish-English students’ language use moved fluidly and dynamically not just between Spanish and English but also between deviations for specific social and academic purposes. This act of translanguaging offers opportunities for both the teacher and students to engage and construct discursive spaces in which they can practice and acquire social meanings in school. Davila (2017) discussed newly-immigrated students’ role as a language broker in a Swedish school. Through the help of teachers, language aides, and peers who valued and supported first language use and development, the students built social and linguistic capital, disrupting cultural and linguistic deficit stereotypes with and through practicing multilingual identities. These acts of translanguaging are agential and creative, as speakers decide when and how to follow or not to follow normative language constructs, “pushing and breaking the boundaries between the old and the new, the conventional and the original, and the acceptable and the challenging” (Li, 2011, p. 382).

Language brokering

Bilingual students use their language strengths to increase human capital, particularly through the practice of language brokering. Orellana’s (2009) ethnographic work demonstrated that children used both Spanish and English as language brokering on behalf of their families. Children, proficient in both languages, worked with their families translating and interpreting in the home and

community. Zhang's work (2007) demonstrated a nine-year-old Chinese-English bilingual communicating and translating for his grandparents when they were out talking with native speakers of English so that the older generation was able to participate in social practices. Orellana et al. (2003) found that Spanish-English bilingual students not only translate words, letters and phone calls for their parents but also legal documents and bank statements. Their family members depended on their bilingualism and expected their help.

For many bilingual students, translating is a part of their life (Jiménez, 2000). In Jiménez's research, a Spanish-English bilingual kid who was labeled as having learning disabilities expressed his concerns about losing Spanish and played the role as a Spanish tutor for his sister. While schools often assume that bilingual students come from homes/communities where literacy is impoverished or not well supported (Morrow, 1995), bilingual children do not lack literacy experiences outside of school. In fact, they exercise power and actively participate in their households and adults' socialization by helping their families access resources and information through a variety of ways across social domains.

Translanguaging as human capital building

Biliteracy and linguistic fluidity, such as in translanguaging, offers a strong basis for the development of bilingual students' voices, identities, cultural contexts, and critical knowledge (Palmer et al., 2014). Li and Wu (2009) argued that the use in and between two languages is a symbolic and creative capital that bilingual speakers own. The authors observed interactions between British-born Chinese students and their Chinese language teachers in complementary schools in Manchester and found that although the school policy was to speak Chinese only, bilingual children were able to creatively use English and Chinese to challenge the traditional ways of Chinese teaching and gained control of the classroom. They used their full linguistic repertoire to negotiate learning practices in class and challenged teachers' authority. The examples in this study suggested that bilingual students were not passive learners in school; they made the school a safe environment through bilingual practices.

Restrict language policies in school and community would limit bilingual students' literacy experiences (Batista-Morales et al., 2019; Moll and Gonzalez, 1994; Ruiz, 1984; Smith, 2016) as well as their social existence (Medina, 2004). Scholars suggested implementing critical literacy pedagogies to create a bilingual as well as bicultural space in school. de los Ríos (2017) discussed how music allowed a Mexican-American student to use the entire linguistic repertoire to tell border tension. Medina's (2010) study showed when the immigrant students were exposed to culturally and linguistically relevant texts, they compared and connected cultural contexts in Mexico and the US, discussed their perceptions of border control, and shared their awareness of border lives. The students collaboratively moved the discussion forward and gave voices to injustice. In Batista-Morales et al. (2019) research, Cristian, a second-grade Spanish-English bilingual student, proposed plan to pick up trash in his community. He and his mom created and distributed bilingual flyers and had a clean-up walk in the neighborhood. Cristian was empowered to respond to an issue in his community when his language and home knowledge was valued. Bilingual students' critical consciousness and their active roles are fostered when the teaching practices focus on what they can do with languages and allow space for bilingual students to creatively use and play languages (Cervantes-Soon et al., 2017).

Research shows that globally bilingual and multilingual speakers engage in the production of highly creative use of languages as contact zones or in the "social spaces where cultures meet, clash, and grapple with each other ..." (Pratt, 1991, p. 34). Centering the notions of linguistic imagination in relation to "invention," "desinvention" and "reconstruction" (Makoni and Pennycook, 2007) in the social mapping of language, we can get a potential sense of the emerging new social futures and forms of existing/new multilingual pedagogical territories (Gutierrez et al., 1999). In the next section, we dive into the use of drama and play as a critical pedagogy in a multilingual and multicultural classroom.

Drama and play pedagogies as performative spaces in biliteracy practices

The use of drama and play as a critical language pedagogy is situated in a perception of education as focused on the ways young people make sense of themselves and the world. According to Medina et al. (2014):

[L]earning is perceived as in motion, emerging from the experiences of all those involved in any one learning moment. This perspective of learning as performed, embodied, and emergent profiles new critical reflections on the ways we are participants of multiple social worlds. From these perspectives, learning is seen as something people "do" in communication and interaction. People's ways of knowing move to the center of any pedagogical exploration so that learning is reframed from focusing on "outcomes" to "incomes"—the histories, cultural and intellectual resources and identities learners bring to and create in classrooms (p. 71).

A critical performative pedagogical approach positions the classroom as an experience that "privileges the fluid, ongoing, often contradictory features of human experience..." (Pineau, 2002, p. 29). All classroom events, either inside or outside of curriculum, are perceived as "spectacles" produced at the intersections of culture and identity in the making (Diamond, 1996; Pineau, 2002). Weltsek and Medina (2007) explained, "classrooms are perceived as spaces where students and teachers perform and imagine multiple social realities addressing political issues, moving beyond superficial understandings of 'difference,' 'the other,' or assumed

‘naïve’ notions of empowerment and instead explore the embedded multiplicity of discourses” (p. 8). In this way, the dynamic interplay between self and other is situated as the space where learning takes place.

Pedagogical practices that foster and support interactive learning spaces built around collaborative performance offer opportunities for bilingual children to cross borders between languages (García et al., 2011). Souto-Manning suggests (2017) when play is used equitably in classrooms, young children are provided openings to “develop sophisticated understandings of academic knowledge and concepts through authentic, engaging, participative, and agentic ways” (p. 785). Through performative practices, children are able to draw on multiple resources to dramatize their thinking; real or imagined events become coupled with their own development of language (Wright et al., 2008). With multiple linguistic profiles at drama and play, a bilingual classroom turns into a space where young children make sense of knowledge and mediate their own identities (García et al., 2011). Furthermore, when intertwined with interpretations from both bilingual and non-bilingual children, the learning environment transitions to a dynamic and ever-evolving space for sharing ideas using personally meaningful modes of expression (Bengochea et al., 2018; Canagarajah, 2013). There is a need to expand and articulate effective pedagogical strategies and practices that assume the importance of personal and social development of biliterate children. The embodied and complex actions that stem from performance-based interactive learning spaces give rise to the importance of infusing drama and play pedagogies in biliteracy classrooms.

Personal, linguistic, cultural and social resources accessed through drama and play

Linking these ideas together, brings forth the ever-evolving importance of providing opportunities for children to learn and express through a variety of performative pedagogies where biliteracy serves as a strength that allows room for influence from the personal, linguistic, social, and cultural resources at play. Moving in between real and imagined worlds serves as an opening to affect agency and meaning making practices and promotes more socially and culturally responsive practices that could benefit the lives of students in and out of the classroom (Edmiston, 2000). This can be especially productive because all children bring different kinds of knowledge to the conversation (Moll and Gonzalez, 1994) thereby enriching the process of knowing through drama and play.

Bengochea et al. (2018) explained an emergent bilingual preschooler’s engagement through a “Show and Tell” activity, where the children’s own sense of meaning making was elaborated as they used gestures and personal stories to describe their objects. Multiple metacognitive functions occurred as the bilingual child switched between languages in communication. The findings demonstrated the holistic communicative competence in and between two languages and also highlighted the importance of validating personal and social resources accessed through this type of engaged showing and telling. Soderman and Oshio (2008) provided an example of competence and social behavior of children in an English-Chinese dual immersion program. The scholars learned that drama provided openings for the children to explore roles, learn rules, and examine power relationships between roles. Duran’s (2018) research explored how young bilingual children drew on social and cultural resources at play and developed “a metalinguistic awareness about how their two languages relate to each other” (p. 75). Deliman’s (2019) longitudinal qualitative case study found that drama-based strategies facilitated understanding of multiple perspectives and promoted opportunities for young children to cultivate empathetic values. Building on children’s social practices also helps enhance their critical awareness as Martello (2001) describes, “Experiencing language as a social practice first-hand and having opportunities to replay and reflect upon the relationships between language and social practices” (p. 201).

Biliteracy as a creative strength in drama and play allows children to move between languages, texts, and knowledge of literacy (Duran, 2018). When flexible bilingual pedagogic practices are enacted, bilingual children can “use their entire linguistic repertoire flexibly, meaningfully, and competently” (Gort and Sembiente, 2015, p. 23) in order to rework and mediate meanings for their social and cultural purposes (Wohlwend, 2019). Through drama and play, openings are created for multiple perspectives and voices to be heard (Medina, 2004). When personal and cultural assets become intertwined with performance, the meaning-making is embedded with real-world scenarios. These performative practices enlist biliteracy as a creative tool that drives enhanced meaning-making through the rich histories, personal stories, and cultural traditions of the playmakers.

Conclusion

In this chapter, we argue that biliteracy is a creative strength. Canagarajah (2011) asserts that translanguaging is performative and a naturally occurring phenomenon that “cannot be completely restrained by monolingual educational policies” (p. 8). Bilingual students are not passive learners or problematic English speakers; they think in and between languages and creatively use the languages through varied and complex ways. There is a need for educators to value bilingual students’ strength in literacy and enact pedagogical practices that allow bilingual students to use their entire linguistic repertoire and access their personal, cultural, and social resources in order to deploy their full capacities in learning (García, 2011).

This chapter included articles addressing critical literacy practices that value and foster bilingual students’ voices in class and specifically discussed using performative pedagogy to connect their personal, cultural, and social resources to the knowledge construction through embodied practices. The collaborative actions and interactions are personally meaningful and demonstrate how meaning-making extends beyond language. When drama and play is structured by the children, there is as the children mediate and negotiate multiple meanings, identities, and social resources. Performance-based play and drama in education creates spaces for students to showcase their multilingual repertoires with greater control of the meaning-making (Dunn, 1998).

Introduction: the challenges of teaching and learning disciplinary literacies

In introducing Halliday’s systemic functional linguistics (SFL), Meg, the first author, asks teachers and literacy researchers to compare the texts shown in Table 1. These examples come from an elementary classroom where students were required to conduct an experiment as a way of developing an understanding of empiricism and the scientific method. One group of students, five girls, decided to test which type of bubble gum would enable them to blow the biggest bubble. After buying different packages of Bubble Yum, Bazooka, and Trident Bubble Gum, the girls developed a procedure for chewing the gum for so many seconds, blowing bubbles, and then placing their bubbles on pieces of paper. They then measured the diameter of each bubble and recorded the data in a table. Their next task was to write a laboratory report on a poster for a science fair for family and community members. In explaining her work, one student named Ava (a pseudonym) explained their project orally as shown on the left of Table 1. Meg asked her to consider how scientists, using the scientific method, might describe the same experience. She offered the text shown on the right. Ava’s response was to laugh out loud and declare, “I’m not talking like that—what do you think I am, a geek?!”

This short interaction reveals how different meaning-making choices in the form of gestures, graphs, words, and grammatical patterns reflect different ways of constructing ideas and experiences; enacting voice, identity, and relationship with others; and managing the flow of extended discourse for a specific purpose and audience. For example, Ava’s text recounts a set of events using predominantly a subject-verb-object pattern. Beginning with the pronoun “we,” her point of departure was herself and her group. In constructing their experiences orally, Ava used “we” as well as the words “gum” and “bubble” to convey what her group did using verbs in the past tense to express everyday activities (e.g., chewed, blew). Regarding voice, she made linguistic choices that conveyed excitement and investment in this project as an engaged student to an adult she most likely positioned in a teacher role (e.g., Look! Really great, so cool!). She also managed the flow of information by repeating keywords to stay on topic and build information over a series of sentences. Lastly, regarding coherence, she used oral discourse markers such as “like,” “so,” and “and” to connect ideas in an additive fashion.

In comparison, Meg’s text, about the very same events, used language and other meaning-making systems, such as a graph, to construct more scientific and technical expressions of disciplinary knowledge, as is more common in the context of “doing science” in school (Lemke, 1990). For example, in explaining the results of the experiment empirically, Meg began with a focus on the data as displayed in the graph to make the data the “doer” or “agent” in the sentence, not a human actor (e.g., “As illustrated in the graph, the data show that Trident chewing gum produced the largest bubbles in this experiment”). This distinction is important because a central premise of the scientific method is close observation and letting the data speak for itself with less human bias. The verb choices also convey a more empirical, as opposed to personal experience, through the use of nouns such as “experiment” and “results” and the verb “hypothesized.” Moreover, the sentence patterns are more varied and longer than the subject-verb-object patterns found in Ava’s text. For example, scientific discourse typically packs more information into sentences through the use of adjectives in longer noun groups and the use of prepositional phrases (e.g., “the largest bubbles in this experiment”). Meg’s text also

Table 1 Comparison of everyday and scientific discourse.

We chewed gum and then blew bubbles. Look! (pointing to a bubble on the paper) Like, Trident is really great, and like we blew the biggest bubble with that. So that’s what we did. And it’s so cool we got to have gum in school!	As illustrated in the graph, the data show that Trident chewing gum produced the largest bubbles in this experiment. These results were unexpected because we hypothesized that the brand of gum would not be a factor in the size of the bubble we blew.
---	---

packs more information into a single sentence using subordinating clauses beginning with “that.” Regarding voice, aspects of identity, and the relationship between interlocutors, Meg’s text is more formal and neutral in ways that construct greater social distance and authority rather than excitement and personal investment (e.g., “These results were unexpected”). Lastly, regarding managing the flow of information, Meg selected the conjunction “because” to explain rather than adding ideas together using “and.”

Ava’s response to Meg’s suggestions for revision indicates that she had an awareness of how language choices function semiotically, especially regarding issues of identity, given that she was not willing to speak like someone who she characterized as “a geek.” And perhaps she had a point. As a fourth-grader, her group’s ability to design a very clever experiment met age-appropriate expectations regarding developing a beginning understanding of empiricism and the scientific method. However, a pressing question remains: How can teachers prepare all students to read, write, and critique increasingly technical texts as they transition from elementary to secondary school, and then to college and/or the world of work? How can teachers prepare students to become generators of knowledge in a rapidly changing social, economic, and political world? Further, how can teachers teach disciplinary literacies in ways that draw on students’ multilingual resources in culturally sustaining ways?

The New London Group, an international group of literacy scholars, explored this crucial question in their 1996 landmark article, “A Pedagogy of Multiliteracies: Designing Social Futures.” Drawing in part on Halliday’s theory of SFL, the international team of authors promoted a “pedagogy of multiliteracies” to advance multilingual/multimodal approaches to teaching and learning in the 21st century (New London Group, 1996, p. 64). Despite the influence of this often-cited article published over twenty-five years ago, teachers, literacy researchers, and policymakers continue to struggle to answer the question of how teachers can design instruction to provide all students with access, scaffolding, and opportunities for critical reflection regarding the types of dense texts they will encounter in school, work, and life (Accurso and Gebhard, 2020). In response to this persistent problem, this chapter explains Halliday’s theory of SFL and describes how educational linguists have used this theory to design disciplinary literacy instruction for a wide variety of students in different K-12 international contexts using the “Teaching and Learning Cycle” (Christie and Derewianka, 2008; Derewianka and Jones, 2016; Janks, 2010; Humphrey, 2017; McCabe, 2021; Rose and Martin, 2012; Schleppegrell, 2004). Next, it provides a critique of SFL-informed pedagogy and concludes with recommendations for future research.

SFL: a social semiotic perspective of grammar

SFL provides a social semiotic theory of meaning-making, learning, and social change (Halliday, 1973, 1978, 1993). Initially developed in the 1960s by Michael Halliday, SFL has expanded into a theory that informs many branches of applied linguistics, including educational linguistics, studies of multimodality, and critical analyses of institutional discourse in a wide variety of fields (e.g., Bartlett and O’Grady, 2017; Christie and Martin, 1997; Brisk and Schleppegrell, 2021; Unsworth, 2001; Young and Harrison, 2004). Halliday’s contribution to linguistics is found in his conceptualization of grammar as a functional meaning-making resource that expands to reflect and construct both the immediate situational and broader cultural contexts in which semiotic systems are used and evolve over time (Halliday, 1993; Halliday and Hasan, 1985; Halliday and Matthiessen, 2014). This context-sensitive and multimodal perspective stands in contrast to behavioral and psycholinguistic conceptions of grammar that have tended to dominate approaches to teaching literacy in the US (e.g., Alvermann et al., 2019; Gebhard, 2019). For example, behavioral understandings of language learning, informed by B.F. Skinner, conceptualize grammar as a set of formal verbal behaviors and language learning as the assembly of sounds, words, sentences, and eventually longer stretches of discourse with stress placed on formal accuracy through practice via formal rules and prescribed text structures (Skinner, 1957; Kaplan, 1966). From this perspective, the work of a teacher typically centers on the adoption of leveled texts to support learners in practicing simple to more complex linguistic patterns to enable them to communicate about everyday experiences. Critics of this approach argue that it may enable students to pass exams that target formal accuracy, but it does not necessarily enable them to communicate about meaningful topics for authentic audiences in creative ways (e.g., Elbow, 1973; Krashen, 1987).

In response, informed by the influential work of Noam Chomsky (1967), many scholars and teachers turned to a psycholinguistic understanding of language and a communicative approach to language and literacy instruction (e.g., Alvermann et al., 2019; Gebhard, 2019). This perspective suggests that all humans are endowed with the cognitive ability to acquire the remarkable complexities of their home language as well as additional languages according to universal rules governing all human languages. Therefore, the job of the teacher is to engage learners in authentic communicative tasks geared toward the learners’ stage of language and literacy development and support learners in creatively problem-solving as they learn to read and write (e.g., Calkins, 1994). This more process-oriented, as opposed to form-oriented approach, often takes the form of teachers guiding students in brainstorming, mind-mapping, drafting, revising, editing, and publishing texts about their personal experiences and opinions as a way of learning to express themselves with less emphasis placed on explicit instruction in how language and other semiotic systems work in the types of texts they are required to read and write across the curriculum (e.g., Elbow, 1973).

Likewise, influential researchers in the field of second language acquisition, such as Krashen (1987), argue that for students to acquire an additional language naturally in ways that mirror first language acquisition, teachers should avoid explicit instruction in grammatical forms. Instead, they should engage learners in communicative activities that generate ample amounts of comprehensible linguistic input and provide opportunities for students to generate linguistic output in a stress-free way that does not focus on errors.

Despite the widespread appeal of more natural and process-oriented perspectives of language and literacy development, many scholars and teachers have noted that these approaches, even after years of classroom instruction, have not addressed the equity gap that has long existed between dominant and non-dominant students, especially for historically marginalized students such as speakers of African American English (e.g., [Delpit, 1988](#); [Gebhard, 2019](#); [Westerlund and Besser, 2021](#)). Nor have these approaches supported monolingual English speakers in the US in developing advanced literacies in additional world languages (e.g., [Byrnes et al., 2010](#)). In response, SFL scholars argue that literacy programs anchored solely in a psycholinguistic perspective of literacy development do not prepare first and second language learners to read, write, and critically engage with the wide range of dense informational texts they are likely to encounter as they attempt to make sense of disciplinary knowledge in mathematics, the sciences, social studies, and language arts (e.g., [Rose and Martin, 2012](#)).

Evidence of this persistent educational opportunity gap, or what [Ladson-Billings](#) refers to as an “educational debt,” is apparent in an analysis of disaggregated assessment data in the US ([Ladson-Billings, 2006](#), p. 3; [Howard, 2019](#)). For example, drawing on the 2017 National Assessment of Educational Progress Data, [Howard \(2019\)](#) reports that “among fourth-graders, 49% of African Americans, 46% of Latinx, and 52% of American Indians read below grade level compared to 22% of whites.” These disparities exist in the area of mathematics in that these same data show “approximately 37% of African American students, 29% of Latinx students, and 31% of American Indian students” score below grade level in “mathematics proficiency compared with 12% of whites ([Howard, 2019](#), p. 18).” [Howard](#) argues that despite widespread gains in graduation rates for students of color, there still exist inequities in these students’ schooling experiences as evidenced by over-representation in special education programs, limited access to advanced placement courses, and lower scores on college entrance exams. In accounting for these disparities, he points to prevailing “deficit thinking” regarding students of color and speakers of varieties of English as well the history of “institutional racism” in US schools ([Howard, 2019](#), pp. 22–30).

In documenting similar problems facing students institutionally designated as “English language learners” (ELL), [Walqui and Bunch \(2019\)](#) provide several important insights that echo [Howard’s](#) analysis. They describe the problem of “deficit” views of multilingual learners and “reductive pedagogical approaches” that “leave some students without access to high quality, intellectually rich discipline-based curriculum and pedagogy” (p. xi). They add that teachers are often viewed as “delivers” of curriculum prepared by others as opposed to capable “designers” of instructional materials themselves (p. xi).

In response, literacy scholars working in a variety of contexts, including first and second language and literacy development, have turned to context-sensitive conceptions of language and literacy development (e.g., [Halliday, 1993](#); [Halliday and Hasan, 1985](#); [Hasan and Williams, 1996](#); [Unsworth, 2001](#)). As described by [Halliday](#), [Hasan](#), and their colleagues, this perspective maintains that language and other meaning-making systems, such as gestures, images, equations, and graphs, cannot be understood without an analysis of the immediate context in which communication takes place, develops, and evolves, nor can these semiotic systems be understood separately from issues of power, ideology, and socialization.

In arguing for a more context-sensitive perspective of the grammar, [Halliday](#) argued for an expansive functional perspective of sociolinguistic practices by maintaining that every act of communication performs three metafunctions simultaneously: The *ideational* function constructs ideas and experiences, such as [Ava’s](#) recounting of her personal experiences and [Meg’s](#) revoicing of this experience as a scientific claim through the selection of different lexical items and grammatical constructions. The *interpersonal* function enacts social roles and power dynamics, such as [Ava’s](#) use of linguistic choices that constructed her as a joyful learner versus [Meg’s](#) choices which construct a more authoritative, neutral, and detached voice—one [Ava](#) rejected because it represented an identity to which she was not oriented. And third, the *textual* function manages the flow of information to make extended oral, written, and multimodal discourse coherent and cohesive. For example, [Ava’s](#) repetition of keywords, synonyms, and pronouns created a lexical chain that stayed on topic and connected ideas using the conjunctions “and.” In contrast, [Meg’s](#) text used more discipline-specific lexical chains to construct a causal explanation using “because.”

In developing this trinocular theory of grammar as a functional social semiotic system, [Halliday](#) maintained that as children, such as [Ava](#), grow up and interact with the world, they have more experiences and ideas to share with a greater variety of people through their uses of a greater variety of language(s) and modes of communicating. Simultaneously, in interacting with a greater variety of people, children, like [Ava](#), learn to use language(s) and varieties of language(s) to construct different kinds of interpersonal relationships with family members, peers, teachers, co-workers, and bosses in ways that are shaped by ideologies related to race, class, gender, religion, and country of origin. Regarding the textual function, as they mature, children, like [Ava](#), learn how to manage the flow of information in oral, written, multimodal, and computer-mediated communication within the diverse cultural contexts in which they participate, including in their homes and neighborhoods, schools, places of worship, at work, and online. [Halliday](#) maintains that this expansion of semiotic resources drives the development of individual meaning-making repertoires as well as the evolution of meaning-making systems themselves (e.g., [Halliday, 1993](#)).

[Halliday’s](#) context-sensitive and functional model of grammar as it relates to K-12 schooling in the US is illustrated in [Fig. 1](#) ([Gebhard, 2019](#), p. 14). This model attempts to capture the complex dynamics that exist between texts and the multilayered institutional contexts in which they are produced and interpreted in schools as well as how schools as institutions are shaped by ideologies regarding language, learning, and the purpose of public education (e.g., [Gebhard, 1999, 2019](#); see also [Bowles and Gintis, 1976](#); [Fairclough, 1989, 1992](#)). This model is informed by over five decades of scholarship produced by educational linguists who have expanded upon [Halliday’s](#) work with the goal of “increasing the range of contexts within which children are likely to participate as they grow older, and the types of linguistic resources learners need to develop if they are to operate successfully in these contexts” ([Christie and Derewianka, 2008](#), p. 6). Based on their experiences as language learners, language teachers, and classroom researchers working with teachers, SFL scholars have theorized and documented how oral, written, multimodal, and

Fig. 1 An SFL perspective and text/context dynamics in schools as ideological institutions (Gebhard, 2019, p. 14). Copyright (2019 ©) From Teaching and Researching ELLs' Disciplinary Literacies by Meg Gebhard. Reproduced by permission of Taylor and Francis Group, LLC, a division of Informa PLC.

multilingual texts construct ideas and experiences, enact self-other dynamics, and manage the flow of communication in schools as historical, economic and political institutions that tend to produce and reproduce dominant ideologies regard language, learning, and social status (e.g., Cope and Kalantzis, 1993; Janks, 2010; Christie and Derewianka, 2008; Christie and Martin, 1997; Hasan and Williams, 1996; Humphrey, 2017; New London Group, 1996; Rose and Martin, 2012; Unsworth, 2001).

Beginning at the center of this diagram, SFL scholars propose that a text can be any multilingual/multimodal stretch of discourse, such as a student using a combination of Spanish and African American English to recount their weekends on their way to class; an editorial about the benefits of bilingual education written in English and Chinese in a bilingual school newspaper; an explanation of a linear equation on an algebra exam written in English; or a PowerPoint analysis of code-mixing and shifting in a novel by Toni Morrison written in Spanish in the context of a bilingual program. These oral, printed, multimodal, multilingual, and computer-mediated texts are constructed through the choice of different phonological, morphological, lexical, clause-level syntactic patterns and/or accompanying ways of using gestures, lines, colors, shading, and images to accomplish specific kinds of work in specific "contexts of situations," such as a high school hallway, a school newspaper room, a math class, or on an online learning platform.

These texts are also situated in the "context of culture" of a US high school. This more abstract layer of this striatal model is shaped by historical, economic, and political ideologies regarding the purpose of public education as well as institutional policies and practices in the US at the federal, state, district, and school levels (e.g., high stakes testing systems, English-only mandates, school funding formulas, student grouping practices, mandated textbooks, and teacher professional certification practices; see also Gebhard, 2019).

Registers

As shown in Fig. 1, at the level of the "context of the situation," Halliday and his colleagues refer to different constellations of sound, graphic, and clause-level lexicogrammatical choices as "registers" to capture the variety of choices people make when communicating about a particular topic for a purpose and audience in a specific situation (e.g., Rose and Martin, 2012). From an SFL perspective these patterned ways of making meaning construct ideas and experience through the ideational metafunction; the voice or stance of text through the interpersonal metafunction; and the coherence and cohesion through the textual function. More precisely, SFL scholars define registers with reference to specific "field," "tenor," and "mode" variables (Halliday and Hasan, 1985, pp. 38–39). For example, Ava and I constructed the same events using very different field, tenor, and mode resources that entail more than just selecting different vocabulary words to say the same thing. Rather, in addition to choosing different lexical items, we used different syntactical patterns, gestures, charts, graphs, and material objects to perform different functions for different social purposes. Ava's field choices constructed her personal experiences through her use of everyday and concrete nouns, referred to in SFL as grammatical

"participants;" verbs, referred to as "processes;" and adverbial and prepositional phrases, referred to as "circumstances." In contrast, my field choices are those required to explore an empirical question through the display of data represented in a graph and through the grammatical participants I selected, including "the data," "these results," and "a factor." The verbal processes, which included "show," "produced," "hypothesize" and various forms of the relational verb "to be." I also selected certain "circumstances" to add details and specificity related to time, manner, and place (e.g., "as illustrated in the graph, in this experiment").

Similarly, regarding tenor, Ava and Meg's linguistic choices reflect a different stance regarding the topic at hand and their relationship to their audience. Ava used a mix of declaratives and imperatives as well as highly emotional language to convey excitement to an interested adult who was curious about her work. In contrast, Meg used only declaratives, more neutral language, and the modal verb "would" to speculate in communicating a scientific explanation using a more detached and authoritative voice for an unknown academic audience.

Regarding mode, the flow of Ava's and Meg's text relied on the repetition of keywords, but Ava's connected ideas using oral discourse markers such as "so," "and" and "like." In contrast, Meg's more decontextualized text utilized longer clauses that were connected with the conjunction "because." These differences are summarized in [Table 2](#) in ways that demonstrate how metafunctions are realized through field, tenor, and mode resources.

Genres

As illustrated in [Fig. 1](#), SFL scholars have noted that field, tenor, and mode choices in the form of material phonological sound waves, print, gestures, graphs, and images do not just reflect and construct an isolated context of the situation. Rather register variables bundle in culturally expected ways to make extended discourse culturally recognizable as performing particular functions through genres, such as recounting an event, telling a story, writing an editorial, producing a mathematical explanation, or making an argument in a literary essay. Martin defines bundled register features as genres that operate at the level of the context of culture ([Martin, 1992](#)). He adds that genres are staged in that they have recognizable parts that perform different functions; are goal-oriented because they have a purpose and audience; and are social practices because they have evolved and will change over time as cultural practices shift ([Martin, 1992](#); [Martin and Rose, 2008](#); [Rose and Martin, 2012](#)). For example, if we overhear a conversation between students in the hallway in which one says, "Dude you are not gonna believe what happened," most of us, based on our previous experiences, might be able to predict that the student is about to tell a story. This genre typically begins with an orientation that locates the hearer/reader in a time and place and introduces a problem, such as "I was driving my dad's car on Saturday during that wicked storm when I ran out of gas." Our hypothetical storyteller might use a combination of Boston English and African American English in conveying a sequence of events that lead to a complication, then a resolution, and sometimes a commentary or "coda" that comments on the narrative as a whole (e.g., [Labov and Waletzky, 1967](#); [Martin and Rose, 2008](#)). In making registerial choices, our hypothetical storyteller might build the field by using packed noun groups (a blinding blizzard of white snow); a variety of action verbs (skidded), verbal verbs (screamed), and mental verbs (worried); and circumstances to add details regarding time, manner, and place (e.g., late at night, on the side of the road, with an empty tank of gas). They might also use emotional, judgmental, or evaluative language to convey their stance on the events using a combination of declaratives, exclamations, and questions (e.g., Damn, that was wild. Dad was mad salty!). Drawing on mode resources, they are likely to use time markers to move the arc of the narrative along in a coherent fashion (e.g., then, next, suddenly, after that, finally).

If this same student then headed off to their algebra class to take an exam in which they were given the equation $y = x^2 - 5$ and asked to give the "range" and "domain" and explain whether the relationship was a function, they would use a different genre and configuration of the field, tenor, and mode choices to achieve a very different purpose and for a different audience (e.g., [O'Halloran, 2007](#)). For example, if this student received adequate instruction in not just subject matter vocabulary, but also scaffolding and explicit instruction in how to explain their mathematical reasoning, they might produce a text similar to the one shown in [Table 3](#). This text reveals that successful students in mathematics can provide an organizing thesis, a set of definitions, a solution, an explanation of their thinking, and a graphic representation of an equation. Moreover, the field choices they make need to be specific to the domain of algebra, which constructs disciplinary knowledge through long noun-groups (e.g., the set of all real numbers) and specific verbs (e.g., substitute, intersect). The tenor is more formal, detached, and authoritative and is constructed through a set of declaratives with no emotion. In addition, the construction of this text requires the use of modal verbs to construct possibility (e.g., can be, could be). Regarding mode, the text flows smoothly through the use of repetition of keywords, the weaving of given and new information in a zig-zag fashion, the choice of certain cohesive devices that support the genre of an explanation (e.g., because, therefore), and the use of language to connect the written text with a graphic display ("as shown," see [Accurso et al., 2017](#)).

In reflecting on the disciplinary knowledge constructed in [Table 3](#), the teachers we work with often remark that they wish their students could produce texts like these, but they are not sure how to set such high expectations, especially if they work with newcomers to dense disciplinary discourses. In response, SFL scholars such as [Hammond and Gibbons \(2005, p. 6\)](#) maintain teachers must "support up" students rather than "dumb down" the curriculum. They contend teachers can do this by coupling a functional perspective of genre and register instruction with a Vygotskian perspective of literacy development. Building on the work of SFL scholars at the University of Sydney, they maintain that teachers can set high expectations when they also provide

Table 2 A summary of SFL metafunctions and register variable used to construct meaning Gebhard and Blaisdell (In Press).

<i>Example 1</i> <i>We chewed gum and then blew bubbles. Look! (pointing to a bubble on the paper).... Like, Trident is really great and like we blew the biggest bubble with that. So that's what we did. And it's so cool we got to have gum in school!</i>		<i>Example 2</i> <i>As illustrated in the graph, the data show that Trident chewing gum produced the largest bubbles in this experiment. These results were unexpected because we hypothesized that the brand of gum would not be a factor in the size of the bubble we blew.</i>
Metafunctions	Register variable	Grammatical resources and their linguistic realizations
Ideational function: Constructs ideas and experiences; constructs the content of a text or what is happening	Field choices	Participants: Nouns, packed nominal groups - Doers/agents (e.g., <i>we, the data, these results, this experiment</i>) - Objects (e.g., <i>gum, the largest bubble, the brand of gum</i>) Process: Types of verbs: - Action (<i>chew, did, blew, produced</i>) - Saying not evident in this example (<i>said, yelled, screamed, moaned, whimpered</i>) - Mental (e.g., <i>hypothesize</i>) - Sensing (e.g. <i>look</i>) - Relating (<i>be, is</i>) Circumstances: Prepositional phrases, adverbs, and adverbial phrases that give information regarding time, manner, and place (e.g., <i>in school, as illustrated in the graph, in this experiment</i>)
Interpersonal function: Enacts social dynamics related to social distance and power dynamics; constructs the voice of the text or the social roles of speakers/hearers or writers and readers	Tenor Choices	Mood to give information and negotiate propositions - Declaratives to give information (e.g., <i>As illustrated in the graph, the data show that Trident chewing gum produced the largest bubbles in this experiment</i>). - Interrogatives to ask for information or an action or to make an offer (e.g., <i>This experiment posed the question, what brand of gum produces the largest bubble?</i>) - Imperatives to command or express excitement (e.g., <i>Look!</i>) Modality to construct degrees of certainty and possibility - Modal verbs (e.g., <i>may, might, can, could, should, will, must</i>) - Modal adverbs (e.g., <i>maybe, probably, absolutely</i>). - Modal nouns (e.g., <i>possibly, likelihood, certainty</i>) Appraisal system to express emotion, evaluate the quality of things or to judge behavior (e.g., <i>really great, so cool, largest</i>).
Textual function: Manages the flow of information in service of coherence and cohesion	Mode Choices	Repeating the same word, pronoun, or synonym to build ideas and stay on topic (e.g., <i>We got to chew gum in school. We blew the biggest bubble with Trident. We thought that was cool</i>). Weaving given and new information together using a zig-zag pattern to build ideas and stay on topic (e.g., <i>This experimented tested different brands of gum. The brand of gum that resulted in the largest bubble was Trident. Trident bubbles measured....</i> Use of cohesive devices and conjunctions to connect ideas (e.g., <i>so, and, because, first, second, third, however, therefore, in sum</i>). Nominalization to construct abstraction (e.g., <i>the bubble-blowing potential</i>).

high levels of explicit instruction and modeling within the students' "zone of proximal development" (Vygotsky, 1978). In Vygotskian terms, this level of social, linguistic, and cognitive support comes in the form of building students' knowledge of the field using hands-on activities and engagement with multimodal/multilingual resources (e.g., video clips) as well as explicitly modeling text interpretation and production practices so students can notice and critically discuss genre expectations and field, tenor, and mode choices. In this way, teachers can build on students' everyday, or "spontaneous," ways of knowing and meaning-making to develop more disciplinary, or "scientific," ways of talking, reading, writing, and critically reflecting on subject matter knowledge (Vygotsky, 1986, p. 148).

This approach, known as the "Teaching and Learning Cycle" (TLC), provides a research-based approach to designing curriculum, instruction, and assessments using five pedagogical stages (for variations on the TLC, see Accurso and Mizell, 2020; de Oliveira and Smith, 2019; Cope and Kalantzis, 1993; Gebhard, 2019; Rose and Martin, 2012). As described by Derewianka and Jones (2016, p. 53), these stages require teachers actively:

Table 3 Algebra: genre and register analysis of mathematical explanation.

Genre stages	Text	Register features
Thesis using the language of the question Definition 1 Definition 2 Solve and explain Graph	I explain that this equation is a function by providing a definition of the equation's domain and range and graphing what it looks like. This helps me see if the equation passes the vertical line test. The domain is the set of all numbers that can be substituted for X in equation. X can be any real number, so the domain is all real numbers. The range is all the possible numbers that can be Y. Because x^2 is positive or at a minimum 0, x^2-5 could be -5 or greater. This means that the range is $Y > -5$. Therefore, the equation, $y = x^2-5$, is a function because, for every possible value for X, there is only one value of Y. One way to show that this is true is to graph the equation and use the vertical line test. If vertical lines intersect the graph at a single point, then the equation is a function, as shown below. 	Content/field Content-specific long noun groups (participants) - <i>A definition of the equation's domain and range</i> - <i>The set of all real numbers</i> Content-specific verbs (processes) - <i>Is</i> - <i>Substitute</i> - <i>Show</i> - <i>Intersect</i> Voice/tenor Declarative sentences and neutral language constructs authoritative facts Modal verbs possibility (<i>can be, could be</i>). Flow/mode Repetition of the word "equation," "domain," and "range" Pronouns and synonyms: <i>equation, function, it</i> Weaving given and new information regarding X: - The domain is the set of all numbers that can be substituted for X (new) in equation. X (given) can be any real number, so the domain is all real numbers. Cohesive devices that support explanations: <i>because, therefore, then</i> Connection between language and graph: - <i>As shown below ...</i> - Use of symbols

Prompt: Give the domain and range of the relationship. Then tell whether the relation is a function. Explain your answer. $Y = x^2-5$.

1. Build students' background knowledge or field resources through multimedia and hands-on tasks that build students' shared understanding of a new topic.
2. Support students in reading a text or excerpts from texts to further build their knowledge and interest in a topic.
3. Deconstruct a target genre collaboratively with students to highlight, literally, the genre's purpose, audience, and stages. This phase also includes drawing attention to key register features as illustrated in the text annotations in Figure 3. [Derewianka and Jones \(2016, p. 53\)](#) note that students need several guided encounters with a specific genre, such as a mathematical explanation, before they will internalize the target genre and register features.
4. Jointly construct a text, such as a mathematical explanation, with students to make visible how to prepare, organize, and produce a disciplinary text that uses language and other meaning-making systems in specific ways. This approach to making literacy practice visible and open to discussion also involves discussing the literal and inferential meaning of words and critically discussing why certain lexicogrammatical choices are more strategic than others given the text's purpose and audience.
5. Support students in going through the same process to research a similar topic and produce a text of their own more independently with less scaffolding.

The TLC was originally developed to teach school based literacies in disadvantaged K-12 schools in Sydney Australia (e.g., [Christie and Derewianka, 2008](#); [Humphrey, 2017](#); [Rothery, 1996](#); [Rose and Martin, 2012](#)). Its use has since expanded to include the teaching of content based English instruction internationally (e.g., [McCabe, 2021](#)); and the teaching and learning a world language such as Arabic, French German and Spanish (e.g., [Abdel-Malek, 2020](#); [Colombi, 2009](#); [Byrnes et al., 2010](#); [Trojan et al., 2022](#)).

Critiques to SFL pedagogy and their responses

Despite promising research conducted internationally in elementary, secondary, and tertiary contexts, SFL pedagogy has been sharply critiqued for valorizing disciplinary literacy practices as "superior" to everyday literacy practices and thus contributing to

deficit perspectives of students' home and community semiotic resources (Thompson and Watkins, 2021, pp. 14–15; see also Flores, 2020; Flores and Rosa, 2015; Luke, 2018). Others, such as Bawarshi and Reiff (2010) cite concerns about the “degree of formalism” and lack of creativity exhibited by an approach to teaching in which genres are “classified and then modeled to students as though they were given” (p. 35). Johns (2008, p. 245) echoes this concern by describing how novices need to acquire genre schemas as a pathway toward more expert textual practices, but also need to be able to revise these schemas to meet the demands of a specific situation given that genres are evolving and must be reformulated for shifting situations. Others, such as Bourke (2005), capture the pervasive impression that SFL's metalanguage is too technical and “messy” to gain widespread application in teacher education. And last, Luke (2018) contributes an additional warning related to claims of empowerment and social change through the use of SFL teaching and learning practices. Drawing on Bourdieu's formulation of language and power, he writes that the “possession” of disciplinary genre and register knowledge, or what he refers to as “symbolic and cultural capital,” is “neither necessary nor sufficient for economic and social power” (Luke, 2019, p. 160). Rather “institutional racism,” as well as classism, sexism, and other ideologies related to the politics of difference within classrooms, schools, and society are apt to prevent historically marginalized populations, such as people of color, women, and immigrants, from ultimately “converting” disciplinary literacies learned in school into “economic capital” outside of schools (Luke, 2019, p. 162). Luke concludes his critique by stating that the move toward explicitly teaching high stakes genres has been valuable, but there is a “danger” if we:

... fail to situate, critique, interrogate, and transform these texts, their discourses, and their institutional sites—coming full circle back to enshrining, reproducing, and making invisible their bases in conflict, power, and difference. To do so is to place these genres, their teaching and reproduction in classrooms, workplaces, and bureaucracies beyond criticism. It is to present them as essential and compellingly functional, but not political and ideological. Without reconsidering its own social and cultural consequences, genre teaching runs the risk of becoming an institutional technology principally engaged in self-reproduction of the status and privilege of disciplinary knowledge, rather than part of a broadly-based political project for remaking the institutional distribution of literacy and its affiliated forms of capital.

Luke (2018, pp. 163–164).

In response to these critiques, SFL scholars and teacher educators have formulated and reformulated their theoretical models and approaches to pedagogy. For example, Hasan (2003), an early influencer in the development of SFL and SFL pedagogy, calls for the use of reflection literacy. She maintains that this type of reading and writing instruction requires students to develop the abilities to not only decode and interpret texts through a close analysis of genre and register features but also to reflect on the social significance of how language and other meaning-making systems construct knowledge. She writes, “the literate person should be able to interrogate the wording and the meaning of any utterance” to determine whose perspective is presented, whose perspectives are excluded, and how different ways of constructing knowledge impact the world we live in (2003, p. 447). Likewise, Martin (2000) stresses that enacting an SFL-informed approach to literacy development cannot be anything but “ideologically committed” (p. 116) and Christie highlights that Halliday's theories, informed by Marxism, have always focused on the issue of equity (Christie and Martin, 2009). In reviewing a “critical SFL praxis approach to teacher education,” Troyan et al. (2020) draw attention to the influence of Marxism in the formulation of SFL. Halliday writes the purpose of developing SFL was:

To give value to the language of the “other” non-European languages, unwritten vernaculars, non-native varieties of English, non-standard dialects... this motif has remained constant, as the main ideological input to what evolved as systemic theory. The theory has never been neutral.

Halliday (1993, p. 74), as cited in Troyan et al. (2020).

In the US, an explicitly critical instantiation of SFL pedagogy, one that serves the dual purpose of scaffolding students' disciplinary literacy development and their ability to detect and challenge specific ideologies, is evident in some but certainly not all studies of SFL teaching practices. For example, in a comprehensive review of 136 published articles regarding SFL research conducted in the US between 2000 and 2019, Accurso and Gebhard (2020) found that only 43% of teacher professional development (PD) programs reported gains in the area of critical language awareness. These programs were designed to guide teachers in understanding how semiotic choices construct subjectivities and ideologies in the texts they encounter in school. These studies demonstrated that after participating in SFL-informed PD, teachers approached teaching disciplinary texts differently and began to view their students' literacy practices from a resource as opposed to a deficit perspective. For example, several studies conducted with social studies and science teachers showed that when teachers were guided to question texts commonly presented as factual, they began to denaturalize dominant assumptions about language use in schools (e.g., informational texts are facts devoid of author attitude, opinion, or ideological stance; see Achugar et al., 2007; Achugar and Carpenter, 2012; Carpenter et al., 2014; Gebhard et al., 2014; O'Halloran et al., 2015; Ramirez, 2014; Schleppegrell et al., 2008). However, these studies did not show these lines of critical questioning extending beyond individual sets of disciplinary texts to examine how broader school practices and societal ideologies influence semiotic choices across texts.

A second much smaller group of studies, also reviewed by Accurso and Gebhard (2020), demonstrated more engagement with macro-level critiques of schooling policies and practices. For example, Gebhard et al. (2008) documented two first-grade teachers' experiences analyzing text-context dynamics. As part of their master's degree program, these teachers analyzed the literacy practices of a first-grade bilingual student who had been characterized as “mixing Spanish and English” in ways that might “interfere” with

her academic progress (p. 280). However, by analyzing this student's writing to understand the influence of historical, political, and economic aspects of the context in which it was produced, the teachers were able to see how school reforms related to English only mandates and high stakes testing shaped this student's opportunities for disciplinary literacy development. Further, they were able to see how this student drew on a wide variety of out-of-school semiotic resources in completing school-based tasks.

Similarly, Harman (2007) documented how one eighth-grade teacher experienced a perspective shift throughout her teacher education program experience from a deficit orientation toward students labeled "English learners" to "affording them multiple literate identities" (p. 31). Before participating in an extended professional development program, the focal teacher admitted to seeing some of her students and their work as problematic because they spoke Spanish. However, as this teacher analyzed multilingual students' texts in relation to her own teaching practices and school policies, she began to notice and question her own monolingual orientation and looked for new ways to design multilingual/multicultural curriculum and instruction.

Collectively, Gebhard (2019) and Harman's (2018) work signal a critical shift in the use of SFL pedagogy in US teacher education and classroom research. Both focus on a critical praxis perspective and language, learning, and social change in teacher education. Gebhard's work is influenced by Fairclough's (1992) conception of critical discourse analysis to inform debates regarding institutional discourses of public education and Dyson's (1993, p. 28) concept of designing a "dialogic" or "permeable curriculum" to create inroads to using disciplinary discourses that draw on historically marginalized students' home and community linguistic resources (Gebhard, 2019). Harman's work is more inspired by Paris and Alim's (2017) "culturally sustaining pedagogy" and New London Group's (1996) construct of multilingual and multimodal meaning making (e.g., Harman, 2018; Harman and Burke, 2020; Khote and Tian, 2019).

Other US scholars have also expanded SFL-informed conceptual frameworks and related pedagogical practices to include a stronger focus on SFL within the following programs and conceptual domains:

- Dual language programs (e.g., de Oliveira and Westerlund, 2021; de Oliveira and Smith, 2019; Ramirez et al., 2018)
- Culturally sustaining family literacy programs (e.g., Ramirez, 2020)
- Heritage language learners (e.g., Achugar and Colombi, 2008; Colombi, 2009, 2015)
- Critical race theory and raciolinguistics (e.g., Accurso and Mizell, 2020; Mizell, 2021; Thomas, 2013)
- Multimodality (e.g., Accurso et al., 2019; Shin et al., 2020; Harman and Burke, 2020)
- Teacher action research and critical language awareness (e.g., Gebhard and Graham, 2018)
- State and district policies and practices influencing the education historically marginalized bilingual learners (e.g., Turriago, 2020)

Future directions for SFL scholarship in the US: personal reflections

These recent studies respond to critiques of SFL and call for scholars, teacher educators, and practitioners to address systemic inequities related to language, language variation, and the construction of race-, class-, and gender-based inequities in US schools. Some of these studies do so in ways that productively couple Halliday's theory of SFL with other critical sociocultural perspectives of language, learning, and power in schools as ideologically driven institutions. For example, the pairing of SFL with multimodality (Kress and van Leeuwen, 2001), translanguaging (García and Wei, 2014), culturally sustaining pedagogy (Paris and Alim, 2017), critical language awareness (Janks and Locke, 2008), and critical race theory (Delgado and Stefancic, 2017) has been fruitful, especially in the context of the Black Lives Matter Movement and other structural inequities made even more visible by the Covid-19 pandemic (Gebhard and Accurso, in press).

As SFL research and SFL-informed PD initiatives emerge to respond to these inequities, we suggest that connections with commensurate theories will have more traction if researchers and teacher educators strive for conceptual and methodological clarity regarding what they mean by language, learning, and social change. This clarity is essential if SFL-informed practices are to avoid the slippage into more conservative and behavioral approaches to teaching and learning that happens all too often in US schools as they strive for efficiency and standardization (Callahan, 1962; Gebhard, 2019; Trujillo, 2014). In addition, this recommendation will also enable researchers and practitioners to be clearer about what their disagreements are. Are their disagreements related to different conceptions of grammar (e.g., behavioral, psycholinguistics, or social semiotic perspectives)? Different perspectives regarding the nature of learning (e.g., behavioral, psychological, sociocultural)? And/or different conceptions of power and what social justice looks and sounds like in schools (assimilationist vs. multicultural/multilingual or structural vs. post-structural)?

In addition, despite many mission statements using the words "bilingual," "equity," or "social justice," the K-12 schools and licensing programs that we have worked in, driven by ever-expanding sets of standards, high stakes testing practices, and diminishing resources for sustained engagement with complex topics, often revert to assimilationist and behavioral perspectives of language and teaching that support English monolingualism, white supremacy, and middle-class norms. Within these contexts, we notice that language is still treated as a decontextualized and neutral set of formal rules regarding sentence structure with less attention to the function of linguistic variation (e.g., African American English), register features, genre stages, and students' investments in learning to read, write, and discuss disciplinary topics for authentic social, academic, and political purposes. In these cases, under-resourced schools and teacher licensing programs often lack the time and capacity for authentic and sustained critical reflection as advocated for by Luke (2019). In moving forward, we recommend that future studies of SFL in the US attend more seriously to the institutional context in which teachers learn and work. These contexts place many demands on teachers, demands that

compromise their ability to use SFL and act as transformative educators capable of supporting multilingualism, setting high expectations, providing high supports, and fostering critical reflections. Therefore, we recommend that more attention be paid not just to conceptions of language, learning, and social change, but also to how teachers are supported in using systemic functional linguistics over time.

Introduction

Over the last two decades, some progress has been made in improving the literacy achievement of young adults around the world. However, one in four still do not meet a minimum level of proficiency in reading (Organisation for Economic Cooperation and Development, 2019). Writing is an extremely complex skill (Hayes, 2012) that is inextricably related to reading (Fitzgerald and Shanahan, 2000), as they are mutually supportive of each other. This raises concerns that many students do not possess the reading and writing skills that will allow them to meet the demands of secondary school.

Prior research suggests that students who struggle with writing are less likely to use writing as a tool to support and extend their learning across all disciplines, including science, math, and social studies (Bangert-Drowns et al., 2004; Graham and Hebert, 2011). This is especially problematic because writing serves as one of the primary means for students to convey their thoughts and ideas, as well as for teachers to assess their learning and understanding (Graham, 2006). Even as young people have more tools than ever to convey their knowledge and beliefs, there is an increasingly narrow range of writing practices that are used to indicate literacy achievement. If students are unable to use writing as a way to represent their disciplinary knowledge, then it may be more difficult for them to graduate from secondary school, pursue further education, and prepare for the workforce. This is compounded for youth who are learning English as an additional language.

English language learners represent the fastest growing segment of the student population in many countries. Notably, the percentage of primary and secondary students in government schools who are English language learners (ELLs) is now at 10% in the United States (United States Department of Education, 2019), 19% in England (Department for Education, 2019), and 25% in Australia (Australian Curriculum Assessment and Reporting Authority (ACARA) 2020a). Compared to other literacy skills such as reading, speaking, and listening, writing is often the most difficult skill for ELLs (Cumming, 2013; Snow and Uccelli, 2009).

ELLs who have already learned to write in another language often have disciplinary knowledge and literacy skills that can facilitate their writing in English, but they still experience challenges. For instance, the differences in cultural norms, rhetorical styles, and academic discourses may lead to students' resistance to and difficulty with writing tasks (McCarthy and Garcia, 2005). In this chapter, we explore writing pedagogy for English language learners. We begin with a review of the international literature to highlight evidenced-based elements of writing instruction and to explore how ELLs' linguistic and cultural resources shape their writing development. Then, we turn our attention to policy and pedagogy in the Australian context, offering insight into how one country has strived to meet the needs of the rapidly growing number of English language learners. Lastly, we draw on our own research in Australian secondary schools to show how creative writing through spoken word can support the literacy and identity development of ELLs, which in turn impacts ELLs' writing engagement and achievement.

Writing pedagogy and English language learners

There is global concern for students' writing development (Graham and Rijlaarsdam, 2016). Writing has been described as a "complex of interconnected systems" (Nelson and Nelson, 1978, p. 278) and learning how to write requires substantial time and effective instruction (Graham et al., 2012). In schools around the world, students' knowledge and understanding are commonly assessed through writing. However, assessment-driven writing instruction typically tends to "narrow views of writing to the mastery of widely-used processes in order to create a product that conforms to recognisable standards" (Peterson et al., 2007, p. 30). Research suggests that writing pedagogy needs to reflect the "richness and complexity of literacy practices evident in society at large" (Street, 2005, p. 4) rather than conceptualize writing as a discrete skill that students must master and perform on demand. This literature review will consider why writing is important to students' learning, how teachers can effectively teach writing in secondary schools, and how English language learners, in particular, can become capable and effective writers.

Writing and learning across disciplines

Writing allows students to learn new concepts, express ideas, create fictional worlds, and engage in meaning making. For that reason, writing is instrumental to students' learning, especially when it involves authentic writing tasks and real audiences (Graham and Harris, 1997). Writing also enhances students' literacy skills more broadly. When writing is included as part of reading instruction, for instance, it improves students' ability to decode and comprehend information (Graham et al., 2018). The nature of literacy means that writing, reading, speaking, listening, viewing, and representing can develop in mutually constitutive ways. For this reason, this chapter, whilst focusing on the mode of writing, explores the reciprocal relationship across the modes to support writing development.

Being able to write enhances students' performance in multiple disciplines, and students comprehend and retain material better in science, social studies, and mathematics when they write about it (Graham et al., 2011). Research suggests that simply increasing the frequency of writing will not enhance students' knowledge and understanding about a specific topic (Applebee, 1984); rather, factors such as the nature of the writing task and teachers' level of preparation and confidence can substantially impact the influence of writing on learning (Bangert-Drowns et al., 2004; Gillespie et al., 2014). A meta-analysis by Graham and Perin (2007) examined 26 studies on writing to learn, that included students from upper primary through secondary schools. Their work found that writing to learn has a positive impact and 73% of studies demonstrated that writing can improve student learning in language arts, social studies, and science. Another meta-analysis by Graham and Hebert (2011) included 66 writing to learn studies and focused on the impact of writing on understanding information. They found that 94% of the studies showed that writing about material read enhances students' comprehension of texts across disciplines. Whilst the meta-analysis was conducted across the general school population, Graham and Hebert (2011) note that the reading performance of ELLs is often statistically lower than their native English speaking peers but that "writing about reading had a positive impact on the comprehension of weaker readers/writers" (p. 728). Furthermore, the effect is stronger, particularly for high school students, when students are explicitly taught how to write about their reading (Graham and Hebert, 2011).

Writing pedagogy: from promise to practice

While writing can substantially support student learning, international scholarship has shown that writing instruction in most classrooms is not sufficient. A recent literature review synthesized findings from 28 studies involving the writing practices of more than 7000 teachers in the United States, Europe, Asia, South America, and Australasia. Within this, Graham (2019) argues that these global studies of writing found that "some teachers provide students with a solid writing program, and in some classrooms this instruction is exemplary" but "this is not typically the case, as writing and writing instruction in most classrooms are inadequate" (p. 279). Notably, these findings were relevant across countries and grades.

While most secondary teachers believe that writing can facilitate student learning, this is not necessarily reflected in their pedagogy and they may not dedicate time and attention to using writing to support learning (Applebee and Langer, 2011). Despite the importance of writing for students' learning in all disciplines, it is more likely to be taught in language arts and most other classes relegate writing to activities such as filling in the blanks or copying, rather than composing substantial texts (Gillespie et al., 2014; Ray et al., 2016). A study by Ray et al. (2016) found that writing short answer responses, taking notes for reading or while listening, and completing worksheets were the most frequent writing strategies reported by secondary teachers; on average, these strategies were used once a week. Writing disciplinary-specific texts like a literary analysis or a lab report were reportedly used less than once per year.

As a whole, secondary teachers directly teach less than half of the writing to learn strategies that they asked their students to apply (Ray et al., 2016). This is problematic because writing like a scientist is different from writing like a historian - they involve making meaning from different kinds of sources, writing in different genres, and writing for different audiences and purposes. Moreover, students' writing in one genre is not highly predictive of their writing in another (Graham et al., 2011). This reflects the tendency to treat disciplines as "static corpuses of fact" and not "dynamic sets of discourses and practices, literacies and knowledges" (Luke, 2000, p. 139). A study by Gillespie et al. (2014) found that secondary teachers are more likely to implement writing to learn strategies in the classroom if they have more preparation, greater confidence in their writing pedagogy, and more diverse classrooms.

Gadd and Parr's (2017) and Ortmeier-Hooper's (2013) research further highlighted that effective teachers of writing emphasize task selection, direct instruction, and building self-efficacy and self-regulation.

English language learners' writing

The concept of writing varies across countries, and even when tasks are well-defined, cultural differences and expectations impact both students and teachers (Purves, 1992). For the growing number of English language learners, the development of higher-level reading and writing skills is essential for them to navigate the complexity of academic English (Scarcella, 2002). Since it may take ELLs a number of years to develop grade appropriate reading and writing proficiency in English, it is essential that schools offer ongoing and differentiated literacy instruction across disciplines. Cumming (2015) synthesizes recent research and argues that there are nine interrelated approaches to support ELLs' writing development, including "regular routines to scaffold writing tasks; strategy instruction and practice; collaborative writing; content-based teaching; development of metalanguage, genres, and vocabulary; teacher development; supporting literacies outside of school; dual-language programs; and tutoring" (p. 366). Many of these approaches can readily be integrated into disciplinary classrooms to support ELLs' learning broadly as well as their writing for specific audiences and purposes.

Writing pedagogy for ELLs needs to account for their language background in ways that are fundamentally different from native English speakers of the same age. First, ELLs are often learning to speak and write English concomitantly, which impacts how teachers understand their content knowledge and literacy skills. Gibbons (2015) explains that many countries tend to "assess ELLs as though they have identical language resources to English mother tongue speakers... [and] fail to recognize what ELLs learners actually do achieve in their learning of English" (p. 98). Second, assessments also rarely acknowledge that many ELLs are literate in another language, or reflect the fact that some ELLs may also be learning a new script. Cumming (2015) argues that a more productive approach would involve creating assessments for ELLs based on normative trajectories for their literacy development. Alternative approaches to assessment are necessary so that ELLs' full language resources and literacy skills can be accounted for in school-based assessments.

In conceptualizing English language learners' abilities, teachers may unintentionally perpetuate a deficit discourse, which "locates its explanation of the underperformance or underachievement of non-dominant students in the nonalignment of the cultural practices of the home and school" (Gutierrez, Zitali Morales, and Martinez, 2009, p. 218). Alford (2014) argues that ELLs need to be able to utilize a wide range of resources and tools to express their ideas and understandings, rather than being forced to write analytically and sophisticatedly in a language they have not mastered. Janks (2010) adds that young people need access to school-based literacies, including the experience of writing for academic purposes, in a range of genres, and for different audiences. For ELLs, this can be challenging if they "have no experience of meaningful, pleasurable, fluent writing on which to build" (Janks, 2010, p. 158). For that reason, secondary teachers must strive to understand the background knowledge and literacy resources that ELLs bring to disciplinary learning, and consider how to design instruction and assessment that can account for their developing understanding of English language, grammar, and syntax.

Writing pedagogy needs to "value literacy learners' funds of knowledge and the ways in which they can inform literacy teaching" (McLean et al., 2009, p. 169). ELLs bring many linguistic and cultural resources with them into the classroom, and writing pedagogy must reflect that. For instance, Hornberger and Link (2012) argue that translanguaging is becoming more recognized in educational contexts, as it values how multilingual students make meaning "by drawing on and intermingling linguistic features from different languages" (p. 240). Research by Velasco and Garcia (2014) shows that translanguaging can effectively be used by ELLs at all stages of the writing process, including planning, editing, and production, as well as to promote self-regulation. Similarly, because poetry encourages the exploration of diverse linguistic and cultural competencies (Cahnmann, 2006), it can be considered as a genre of access for English language learners (Friedman et al., 2019). Poetry is personal, malleable, and authentic, while at the same time working within and against rules of language and structure. Educational policies and curriculum mandates in some countries recognize ELLs' funds of knowledge and language resources. For example, the Australian Curriculum Assessment and Reporting Authority (2020a) argues that ELLs' cultural and linguistic resources can support their English language learning and disciplinary knowledge while also being shared in the classroom for the benefit of all students. In the following section, we focus on how Australian policy and pedagogy can support English language learners' writing development in secondary school contexts.

Supporting English language learners in secondary schools: Australian policy and practice

Australia is one of the most culturally and linguistically rich countries in the world with students coming from over 2000 different ethnic backgrounds (ACARA, 2020a). With the introduction of Australia's national curriculum being progressively implemented since 2009 (ACARA, 2020b), the universal terminology in Australia for English Language Learners became English as an Additional Language/Dialect (EAL/D). This definition encompasses overseas and Australian-born students whose first language is a language other than English who require additional language support to develop Standard Australian English; students whose parents use Auslan as their first language; and the dialectical 'D' component is inclusive of Aboriginal and Torres Strait Islander students whose first language is a creole or a variety of Standard Australian English such as Aboriginal English (ACARA, 2020a; New South Wales Department of Education (DoE), 2020). Across primary (Years K – 6) and secondary (Years 7–12) school,

approximately a quarter of Australian students are learning English as an additional language or dialect (ACARA, 2020a). In the New South Wales (NSW) state government sector alone, more than a third of students come from language backgrounds other than English and nearly 60% are located in the Sydney metropolitan area (NSW Department of Education: Center for Education Statistics and Evaluation, 2019). Correspondingly, some schools may have an EAL/D student population as high as 90% (ACARA, 2020a). The following sections offer an overview of Australia's EAL/D frameworks and policies, an exploration of how grammar has shaped writing pedagogy and curriculum, and insight into how the teaching and learning cycle can support English language learners' writing.

Australia's EAL/D policy and context

Australia's EAL/D policies exist at federal and state levels, and are informed by the student demographics, local contexts and theoretical frameworks. At a national level, documents such as *The Melbourne Declaration on Educational Goals for Young Australians* (Ministerial Council on Education, Employment, Training and Youth Affairs, 2008) and *The Alice Springs (Mparntwe) Education Declaration* (Education Council, 2019) help underpin EAL/D education in schools through their goals of excellence and equity. The individual needs of all young Australians, regardless of background, are to be supported with students having access to quality education that encourages "high expectations" and is inclusive "free from any form of discrimination" (Education Council, 2019, p. 4). However, both the implementation of the Australian Curriculum and EAL/D support is the responsibility of state and territory government authorities (ACARA, 2020a), and as such, variation occurs.

In the state of NSW, for instance, for newly arrived secondary students (ages 12–18) whose first language is not English, they may attend an Intensive English Center which provides short-term targeted English language support for up to approximately one year (DoE, 2020b) before they move to mainstream secondary schools. The *NSW EAL/D Advice for Schools* (DoE, 2020a) which is an implementation guide for the *NSW Multicultural Education Policy* (2005), presents a range of second language acquisition theories to help contextualize general timeframes and language acquisition stages. For example, it includes Thomas and Collier's (1997) model of academic English where it takes approximately 4–7 years to develop academic English with EAL/D support if students have education and literacy in their first language; and Cummin's (1979, 1991) Basic Interpersonal Communication Skills (BICS) and Cognitive Academic Language Proficiency (CALP) model. Within the school context, BICS is framed as conversational or social language and takes, on average, up to two years to acquire. CALP, on the other hand, is considered the academic language needed for success at school and takes a beginning EAL/D student 5–7 years to develop and up to approximately 11 years if they have had disrupted schooling (DoE, 2020a, pp. 19–21). Given these approximate timeframes, the reality is that the majority of students needing English language support are in mainstream secondary schools.

Mainstreaming in Australia is where grade level curriculum is accessed and demonstrated through English as the medium of instruction and "each area of the curriculum has language structures and vocabulary particular to its learning domain, and these are best taught in the context in which they are used" (ACARA, 2014, p. 6). However, research in English speaking countries have reported that mainstream teachers are often ill-equipped and under-prepared to teach English language learners (e.g., Cajkler and Hall, 2009; Cruickshank, 2009; Cummins et al., 2012; Franson, 1999; Harper and de Jong, 2009; Leung and Franson, 2001; Rushton, 2008; Sinclair and Lau, 2018; Turkan and Buzick, 2016). How to prepare mainstream teachers to embed linguistic, cognitive, sociocultural and contextual knowledge into content instruction in order to meet the needs of EAL/D students is a complex task with no clear agreement on best practice (Costley, 2014; DelliCarpini and Gulla, 2016; Harper et al., 2010; Janzen, 2008; Villegas, Saiz de La Mora, Martin, and Mills, 2018; Von Esch and Kavanagh, 2018).

With the present EAL/D legislation in place at both national and state levels in Australia, there is a lack of consistency across jurisdictions as EAL/D provisions are determined largely based on school context. For example, the NSW EAL/D system has shifted from state-based infrastructure to *Local Schools, Local Decisions* (DoE, 2014) with a student-based funding model. The responsibility of supporting EAL/D student needs is now determined by principals who have the flexibility in decision-making and budget expenditure (DoE, 2014). The decentralization of the EAL/D services has raised concerns of accountability over EAL/D funding and programming (Australian Council of TESOL Association (ACTA), 2017, 2018; Joint Standing Committee on Migration, 2017; NSW ESL and Refugee Education Working Party, 2013). The concern lies in the lack of transparency as it hinges on what the principal determines as the "local need." This in turn is problematic as the variability obscures the data making it difficult to be able to analyze the effectiveness of all the services that schools potentially offer to meet the needs of EAL/D students (ACTA, 2017). This has major implications for research as comparative points may be dependent on localized contexts. Despite this, the one variable that remains consistent is the mainstream curriculum.

Currently, EAL/D programming is governed largely by the expectations of the mainstream curriculum (Williams, 2010). In terms of subject English, at a national level during the last decade, the *Australian Curriculum: English (ACE)* (ACARA, 2014), including senior secondary curriculum (Years 11–12), has been implemented with state and territories determining how the content will be integrated into existing courses (ACARA, 2020b). Content wise, the ACE is structured into three core strands: Language, Literature and Literacy (ACARA, 2014). In particular, the language strand has been highly controversial (Christie, 2010; Derewianka, 2012; Exley and Mills, 2012; Hammond, 2012; Jones and Chen, 2012; Sawyer, 2010) because it now holds English teachers responsible for the explicit teaching of knowledge about language when grammar instruction has been predominantly absent for the past two generations (Jones and Chen, 2012).

The role of grammar in writing

In Australia and the UK, government initiatives for higher literacy outcomes have focused on reintroducing explicit language teaching (Christie, 2010; Clark, 2010; Myhill, 2005; Myhill and Watson, 2014). From the Australian context, a “back to basics” approach has been championed by politicians with the role of grammar being politically hijacked as a solution for raising declining literacy rates. The problem here lies in that public and political perspectives on the role of grammar have tended to remain strongly prescriptive with a focus on what *should* and *ought* to be taught. In contrast, educators and linguists tend to theorize grammar as descriptive in terms of how language is used with a position that language will continue to change and evolve according to context. Despite this, a renewal of a standardized form of grammar seems to be emerging in countries such as England, the USA and Australia (Myhill and Watson, 2014). In the United Kingdom, both Wyse (2001) and Andrews (2005) undertook systematic reviews to test whether the renewal of grammar in England was supported by empirical research, and found no evidence that the teaching of formal grammar helps improve writing. In contrast, Myhill (2005) views the lack of evidence as a result of writing being a new area of empirical study, which only started developing models since the 1980s. She implies that because there is no theoretical framework of how grammar could support the teaching of writing, then it is not surprising that there is no substantial evidence available.

This dispute on the resurgence of explicit grammar has emerged in Australia with the introduction of the *Language* strand in the ACE. Many researchers (Derewianka, 2012; Exley and Mills, 2012; Hammond, 2012; Jones and Chen, 2012) consider the focus on knowledge about language a positive development, as it brings language to the center of practice. Sawyer (2010), however, contends that because the English curriculum is structured into the strands of Language, Literature and Literacy, it fractures the English subject into silos, and this could result in grammar being taught traditionally in isolation with the potential for it being “a proxy for linguistic competence” (p. 290). These concerns are confirmed in the UK with the introduction of a high stakes national grammar, punctuation and spelling tests in the primary years since 2014 (Department for Education, 2020), and with UK research indicating continued decontextualized grammar teaching with minimal focus on the relationship between grammar and meaning (Myhill and Watson, 2014). Despite this, Australian researchers, postulate that the basing of the ACE on a functional model, which considers connections between context and language use, will shift grammar teaching away from the decontextualized approaches that focus on sentence-level grammar (Derewianka, 2012; Hammond, 2012; Macken-Horarik et al., 2011). Myhill and Watson (2014) suggest that the difference between the UK and Australia’s pedagogical rationale for the re-introduction of grammar is that where there is an absence of a clearly articulated purpose in the UK, Australia on the other hand, has grounded it within knowing about the English language in order to understand how it works and how it can be used as a meaning-making resource.

Exley and Mills (2012) suggest that the ACE provides a new approach to the role of grammar in English content by combining traditional terminology with the principles of systemic functional linguistics, which considers the relationship between cultural and social contexts of texts to determine language choice. Macken-Horarik et al. contend that the inclusion of knowledge about language (KAL) in the curriculum has provided a metalanguage – “a language for talking about language” (2011, p. 10). It has also explicitly highlighted the KAL that teachers need to know and teach (Hammond, 2012). Despite this, Derewianka (2012) asserts that little is known about which features of language contribute to positive literacy outcomes at particular ages/stages. Furthermore, knowing grammar is not enough to use KAL effectively in practice (Harper and Rennie, 2008; Myhill and Watson, 2014). However, large-scale research in the UK, involving 13–14 years old students has produced, for the first time, evidence that contextualized grammar teaching can improve writing (Myhill et al., 2012). This is significant as it provides an “evidenced rationale for developing a purposeful role for grammar in the curriculum” (Myhill and Watson, 2014, p. 49). Interestingly though, this study found that the intervention of explicit contextualized grammar teaching to improve writing benefited more able writers, whereas the impact was neutral for less able writers (Jones et al., 2013). Consequently, this raises questions on the role of grammar in regards to EAL/D pedagogy which centralizes around language knowledge. Clark (2010) suggests that any role of grammar needs to be recontextualized insofar as to build upon teachers’ knowledge bases. Within the Australian debate, Sawyer posits that the role of grammar should be as a teaching device, only used “when judged appropriate by teachers” (2010, p. 290). Macken-Horarik (2012), nonetheless, contends that without stipulated KAL, teachers’ knowledge bases may not be sufficient to identify points of need.

The teaching and learning cycle

Similar to the grammar wars, teaching about writing has also been an ideological battleground split between two dominant camps: progressivist practice versus genre theory. The former, the progressive approaches, stemmed out of a reaction to the traditional teacher-centric prescriptiveness of the 1960s and decades prior (Gibbons, 2015). In particular, Graves’ (1983) process approach to writing grew widespread popularity across Australia, New Zealand, the United States and the United Kingdom during the 1980s (Wyse, 2018). This approach was process-oriented with importance placed on learner choice and the teacher acting in the role of an editor (Wyse, 2018). The underlying philosophy was akin to how students learn to speak without formal instruction, so in a similar token, if students were immersed in a range of writing purposes and forms, then it follows that they would organically absorb these processes and learn to write naturally (Gibbons, 2015; Knapp and Watkins, 1994). Similarly, the ‘Growth’ model which focuses on learning processes and personal response also held a pervasive influence in Australia’s English curriculum since the late 1960s (Sawyer, 2010). One of the main contentions over the new ACE is that the pendulum has swung back toward a more explicit form of practice with “strong emphasis on knowledge as ‘content’ rather than as ‘process’” (Macken-Horarik, 2011, p. 198), as exemplified with the language strand being defined as “knowing about the English language” (ACARA, 2020a).

At the other end of the spectrum is the genre-based approach to teaching writing which is based on a functional model of language founded within the work of Halliday's (1975, 1978) systemic functional linguistics (Derewianka, 2003). This approach to writing is concerned with the interrelationship between the patterns of language choice of the written text and the context in which the text is composed (Hammond and Gibbons, 2005). So, from a genre-based approach the writing process becomes explicit as students learn *about* what types of language can be used within the actual context of the language *in use* (Gibbons, 2015). Genre-based pedagogy gained momentum particularly from the 1980s as a number of critiques toward the progressive approaches heightened in relation to ELLs and students from disadvantaged backgrounds (Knapp and Watkins, 1994). The progressivist approach focused on good ideas and writers' voice but the lack of explicit teaching meant that expectations to achieve success were not always clear. This tended to reinforce social inequalities as it soon became apparent that there were many students who were unable to 'crack the codes' of writing (Knapp and Watkins, 1994). As a result, there was a strong call from many English language teachers for a more explicit form of teaching that directly addressed the language structures and conventions of writing (Gibbons, 2015).

In response, a teaching and learning cycle was developed in collaboration with teachers and linguists (Gibbons, 2015). Research in this area focused on identifying the text types or genres (e.g., Christie, 2005; Christie and Derewianka, 2008; Christie and Martin, 1997; Martin and Rothery, 1986; Martin, 1985; Rose and Martin, 2012) used in school contexts to create a curriculum cycle of teaching and learning. There are four general stages as outlined below (model summary is based on Derewianka and Jones, 2016, pp. 51–54; Gibbons, 2015, pp. 109–121):

Stage 1. *Building the field* aims to develop background knowledge and build a shared understanding of the topic. At this stage teachers can activate students' prior knowledge and build on the content of the text so that students will be able to use this knowledge within their own compositions. At this point, students are still a distance from composing themselves but this field-building process is accumulative and continues throughout the other phases of the model.

Stage 2. *Modeling the genre* involves deconstructing model texts or examples of the genre/text type. This stage explicitly focuses on modeling the form and function of the text, so unpacking the structures, language features and skills that students will need in order to create their own compositions.

Stage 3. *Joint construction* demonstrates the process of composing and allows students opportunities to practice using the skills in a scaffolded manner. For example, the teacher and students might jointly write a model text, workshoping the language features and content required within the genre. Students can also work in small groups to practice applying the particular modeled features and specific language elements, which can help teachers assess their comprehension of the modeled skills and determine whether they are ready for independent construction. Hence, this stage illustrates both the process of the composition and the product that students are working toward. Opportunities can be given to discussing how language is used, to considering alternative ways of expressing and improving ideas, drawing back on previous models and workshoping language features (e.g., grammar, vocabulary, spelling, punctuation) in the context of the language in use and at point of need for students.

Stage 4. *Independent construction* as the title suggests, at this stage students should be ready to compose their own texts with confidence. Students should also be reminded to use appropriate processes of drafting and editing as they work toward a published form of work.

The Teaching and Learning Cycle was originally developed for the explicit teaching of writing (see Rothery, 1996) drawing on the work of Vygotsky (1962, 1978) and the concept of scaffolding (Bruner, 1986) (Cruickshank, 2009). In doing so, a functional grammar for writing pedagogies was developed (see Christie, 2005; Christie and Martin, 1997; Feez, 2002; Macken-Horarik, 2002; Martin, 2009; Martin and Rose, 2008; Rose and Martin, 2012). However, in current practice it is now used as a framework to guide programming across a range of modes and curriculum contexts (Derewianka and Jones, 2016). It is a process that can be applied to an entire unit of work with the four stages being implemented across several weeks or longer "but it is never a single lesson" (Gibbons, 2015, p. 111). For further reading, suggested teaching strategies for each stage can be found in Derewianka and Jones' (2016) *Teaching Language in Context* and Gibbons' (2015) *Scaffolding Language, Scaffolding Learning: Teaching English Language Learners in Mainstream Classrooms*.

Creative writing and spoken word poetry in Australian schools: a case study

In order to situate our prior discussion on how Australia's frameworks, policies, and pedagogies shape the learning experiences of EAL/D students in secondary schools, we now offer a snapshot of contemporary research on creative writing through spoken word poetry. A growing body of research over the past three decades has shown that spoken word can nurture students' literate identities and self-confidence while also challenging problematic social and political structures (Weinstein and West, 2012). By combining the written conventions of poetry with performance, poets can utilize their voices, movements, and gestures to express meaning and connect with their audience (Dymoke, 2017). Prior research on spoken word has found that it builds on the strengths of every student (Jocson, 2005), celebrates human difference (Biggs-El, 2012), and offers a platform for youth to interrogate relevant societal and cultural issues (Fisher, 2015). In Flint and Laman's (2012) study, English language learners were able to use spoken word to link their everyday experiences to broader societal issues. Consequently, Coppola et al. (2019) argue that spoken word can encourage "multidimensional and intersectional explorations of culture and identity" (p. 243). For EAL/D students, in particular, poetry can be a powerful way to explore their lived experiences and cultivate their creative writing within school contexts.

The genre of spoken word poetry connects the written conventions of poetry with performance (Dymoke, 2017; Gregory, 2013). Pedagogically, spoken word poetry has the potential to lend itself to both genre and progressivist writing practices. For example, spoken word poetry supports culturally sustaining pedagogy as it draws on students' sociocultural resources (Paris, 2012) with the focus on developing students' voices and creating space to honor their lived experiences. Thus, the form can be process-oriented as importance is placed on learner choice where students are encouraged to base their writing on their experiences to compose a personal response. This addresses the *Australian Curriculum English* which requires students to "create literary texts that reflect an emerging sense of personal style" (ACARA, 2020c). In addition, the form is also conducive to SFL approaches and provides a vehicle for EAL/D students to learn about language through using language.

Spoken word in context: real talk in Australian schools

Real Talk is an annual initiative of the Bankstown Poetry Slam, the largest poetry slam in Australia, and takes place in high schools in western and southwestern Sydney in New South Wales. Over six weeks, spoken word poetry workshops are facilitated by experienced spoken word poets, who act as mentors, and the workshops are primarily attended by students in Years 9 and 10. Through the weekly workshops, mentor poets work with students to critically explore topics such as culture, gender, and race through poetry. The workshops culminate with an in-school heat, and the winners then compete in a finale at a well-known theater in Sydney. In Jones and Curwood's (2020) study of three schools who participated in Real Talk, half of the students identified as having an additional language other than English, and all schools were identified as low socioeconomic by the federal government (ACARA, 2018).

Poetry offers young adults the opportunity to critically and emotionally explore with the world around them (Kovalik and Curwood, 2019) and to push back against oppressive narratives and power structures (Curwood and Gibbons, 2009). Graham and Harris (1997) emphasized the importance of the creation of "legitimate and authentic writing tasks aimed at a real audience" (p. 417). Spoken word poetry is inherently performative, yet the structure of the Real Talk workshops gave students agency in whether and when they would share their creative work; consequently, as students gain confidence in their writing and performing, they increasingly chose to share their poetry with a wider audience. In this sense, spoken word encourages students to "think about who they are and who others (media, public, dominant discourses) say they are and create dialogue to mediate and negotiate any discrepancies" (Muhammad and Gonzalez, 2016, p. 449). Spoken word offers an opportunity for EAL/D students, in particular, to consider the intersections of language and identity while cultivating literacy skills such as listening, speaking, and writing.

Real Talk cultivates students' understanding of the spoken word genre by creating a safe space to learn about, evaluate the effect, and manipulate elements of grammar and aspects of language without the prescriptiveness and constraints of traditional grammar due to its free form. The teaching and learning cycle can also be applied effectively as the working toward a finished product can be readily backwards mapped, such as modeling the genre through various exemplars to develop a consciousness of language usage with attention to how the relationship between cultural and social contexts, purpose and audience plays an integral role in determining language choice. Our research, however, took the modeling and joint construction phase a step further by partnering students with a Real Talk mentor poet to create "a new learning environment that acted as a third space as teachers stepped back and joined their students in the writing process" (Jones and Curwood, 2020, p. 284).

Multilingualism, multiculturalism, and meaning making

The New South Wales Department of Education (2020a) emphasizes that additional language practices can "support learning in English" (p. 28). In alignment with the state-based frameworks and policies, the Real Talk workshops used "culturally and linguistically inclusive strategies... [such as] encouraging the use of first language" (p. 66). One of the teachers in the study noted that many of her students have "developing literacy skills in English, but are quite sophisticated in their first language." When "no single language or register is privileged" (Gutiérrez et al., 1999 p. 293), EAL/D students are able to capitalize on their rich linguistic capabilities in other languages along with their intercultural experiences to explore within their spoken word poetry. Jones and Curwood (2020) argue that the Real Talk workshops embody culturally sustaining pedagogy in that they nurture multilingualism and multiculturalism, which Paris (2012) suggests are inextricably linked to access and power in our globalized world.

The classroom context plays a significant role in English language learners' engagement and achievement with writing. Not only do the types of tasks and the quality of teacher-student interaction shape students' writing practices (Gutiérrez, 1992), students' academic writing is informed by how they position themselves in relation to the power structures embedded in disciplinary activities (Enright, 2011). Through writing, sharing, and listening to spoken word poetry, EAL/D students are able to learn about poetry broadly, including a variety of literary techniques, but also engage in a "performance of possibilities" (Madison, 2005, p. 190). The Real Talk curriculum encourages students to explore their own identities through poetry; in the first week of the workshops, mentor poets sought to build the field by exploring and defining spoken word. In the next week, students worked with their poetry mentor to consider various aspects of identity, including race, ethnicity, gender, age, sexual orientation, socioeconomic status, and language background. Students used this as a basis to craft an 'I am' poem, which one mentor described as "the things that make up who you are, the things people call you, and the things society says about you" and modeled her own for the students. Arihi, a Samoan EAL/D student, shared that this approach created "a different learning environment" where students' knowledge was valued.

In the Real Talk workshops, students were encouraged to share their creative writing, either through reading it out loud from their seats or performing at the front of the classroom. Thuy, a Vietnamese EAL/D student, said that she felt "intimidated" to perform at first, but the support of peers "gives you the environment where you can talk." Because students' work was not part of a formal

assessment, it offered them more agency over the content and less pressure to write and to speak in a prescribed way. At the same time, students' engagement in the workshops allowed them to fulfill key outcomes of the NSW English Syllabus, including to "critically evaluate the ways bias, stereotypes, perspectives ... are constructed," (NESA, 2012, p. 155). Some students with refugee backgrounds in the workshops had only been in Australia for a couple years. Zara and Armami, from Iraq and Syria respectively, "eloquently conveyed their message" according to their teacher. Jones and Curwood (2020) argue that "by establishing a space where student voices are privileged, Real Talk effectively engaged diverse students with varying personalities and literacy abilities" (p. 4).

Students' multilingual skills can offer them valuable opportunities for access and innovative pathways for power (Paris, 2012). In the Real Talk workshops, half of the students identified as EAL/D. In typical classroom settings, the incorporation of additional languages is either limited or nonexistent. Rather than being seen as an asset, students' multilingual abilities may be overshadowed by a focus on academic English, rather than being seen as a pathway to engaging with language and grammar. Moreover, students typically write on their own and for an audience of one - "the teacher-as-examiner" (Applebee and Langer, 2011, p. 17). Spoken word, in contrast, encourages EAL/D students to write (and to perform) together, and to consider their multilingual skills and multicultural identities as assets for engaging in joint construction. For instance, Jaimini and Miracle's collaborative poem *Culture* draws on their collective knowledge of English, Gujarati, and Māori. In class, Miracle began by writing, "He reo Maori taku reo. He Maori ahau me he koa ana au kit e Maori. My language is Maori. I am Maori. I am proud to be Maori" and Jaimini added, "Hu Gujarati bolu chu. Hu Gujarati chu. My language is Gujarati. I am Gujarati." They continued their poem by exploring the unique aspects of their respective cultures, such as food, before confronting stereotypes, "The words we are speaking, the stories we are telling, have been twisted into something they're not." Later performed at the Bankstown Poetry Slam's Grand Finale, held at the Sydney International Convention Center in front of 4000 people, Jaimini and Miracle received the People's Choice Award.

Spoken word poetry is a powerful way to foster EAL/D students' writing and speaking, particularly through its focus on accessibility, agency, and identity. Gibbons (2015) argues that "spoken language and written language are better understood as a continuum rather than as two discrete forms of language" (p. 79). As such, spoken word poetry has the power to shape how, why, and for whom EAL/D students write, which has a direct impact on how their learning will be formatively and summatively assessed in formal school contexts. For instance, the New South Wales Education Standards Authority has recently introduced a multimodal assessment requirement in English for students in Years 11 and 12, and added spoken word poems from Luka Lesson and Kate Tempest to the list of prescribed texts for study in Standard and Advanced English. Not only does this validate performance poetry as a valued text for academic study, it also creates space for teachers to integrate spoken word, along with digital poems (Curwood and Cowell, 2011) and multimodal counternarratives (Curwood and Gibbons, 2009), into the English curriculum.

Moving forward: developing English language learners' writing practices

This chapter critically discussed some of the complexities and challenges around supporting English language learners in writing development. The review of the international literature has highlighted the significance and increasing need to further develop writing pedagogy that targets language through explicit instruction and builds on funds of knowledge, which Australia's rapidly growing ELL population bring to the country's multilingual and multicultural classrooms. Specific examples of policy and practice situated within the Australian context have illustrated some of the competing mandates, complexities and considerations that influence the implementation of writing pedagogy and EAL/D systems when working within overarching educational structures and institutions. We explored, as suggested applied models of practice, the teaching and learning cycle which provides a means for scaffolded programming that aims to integrate content and language teaching through an explicit instructional framework. We also highlighted how spoken word poetry can serve as a compositional form of creative expression to provide a meaningful way to draw upon and cultivate students' sociocultural resources to move along the spoken to written mode continuum. Multimodality, in this sense, is integral to modern literacies, language, and schooling.

In moving forward, successful support for English language learners, at least in the Australian context, can be "achieved through co-designed teaching programs" (DoE, 2020a, p. 24). Given that in the mainstream curriculum, knowledge about language is taught in conjunction with content discipline, this integration of language and content has been increasingly acknowledged as central to the academic success for English language learners (de Jong and Barko-Alva, 2015; Schlepppegrell, 2004) as it provides exposure to meaningful use of academic language in situational contexts (Schlepppegrell, 2004; Snow et al., 1989). While this integration is typically a pedagogical focus for ELL teachers, in contrast, mainstream teachers are generally not trained in this area (de Jong and Barko-Alva, 2015). Consequently, a dual focus is needed where mainstream teachers develop knowledge on how to address the needs of English language learners, and for ELL specialists to enhance their content knowledge (Tigert and Peercy, 2017). To this, another concern raised in the literature is whether teachers are adequately prepared to teach knowledge about language given the resurgence of grammar within various curricula and the educational sphere (Borg, 2003; Cajkler and Hislam, 2002; Harper and Rennie, 2008; Loudon and Rohl, 2006; Macken-Horarik et al., 2011; Milton et al., 2007; Sangster, Anderson, & O'Hara, 2013). This highlights a need to examine and improve how the development of teachers' knowledge about language is being addressed in teacher education; and for further empirical work that clearly theorizes the role of grammar in the curriculum, and provides evidence-based ways on how and whether it can be taught in a meaningful, contextualized manner to improve writing pedagogy for specific cohorts. Lastly, future research can explore how multimodal assessment can move beyond a print-focused paradigm (Curwood, 2012) to better account for multimodal ways of making meaning and capture students' disciplinary learning and understanding.

Acknowledgments

The authors are grateful to Sarah McCarthy and Eveline Chan for their constructive feedback on an earlier version of this chapter.

Introduction

For most of the time that humans have been walking on this Earth, we have passed along our knowledge and culture through oral traditions, as the elders and those with the most experience have been the storytellers assuring that our collective wisdom is shared with the next generation. Only 500 years ago with the invention of the printing press, alphabetical literacy took prominence and stories could be mass produced and disseminated across the globe. Since then, the innovation of information communication technologies (ICTs), from radio to television to the internet and cell phones, has changed the world. [McLuhan's \(1997\)](#) warning that "the medium is the message" (p. 7) resonates today as never before. Today the wealthiest corporations on Earth are media companies and technology platforms, and with over half the world's population connected to these digital networks our dominant storytellers are now marketeers, buying and selling information, products, our attention, and our personal data, often at the expense of society and the planet.

Disparities of access and information

In UNICEF's "The State of the World's Children 2017: Children in a Digital World" they assert, "Digital technology has already changed the world—and as more and more children go online around the world, it is increasingly changing childhood" ([2017](#), p. 3). They found that the most connected people (those with access to digital technologies and the internet) on the planet are youth between the ages of 15–24 and about one-third of all internet users are under 18 ([UNICEF, 2020](#), p. 4). While this connectivity is increasing globally, access is not equal as the digital divide furthers the disparities. Globally, 2.2 billion youth remain unconnected to the internet at home and access for youth to the internet is also exacerbated in rural communities worldwide, with 25% of rural youth connected in comparison to 41% of youth in urban areas ([UNICEF, 2020](#), p. 7). Additionally, African youth are more disconnected (60% unconnected) than children in Europe (4% unconnected) based on many factors such as: economics, gender, and language ([UNICEF, 2020](#), p. 2). More than half of all websites (56%) are only in English, inaccessible for most people on the planet ([UNICEF, 2017](#), p. 10).

Soon after the World Health Organization declared COVID-19 officially a global pandemic, [Guterres \(2020\)](#), the UN Secretary General, tweeted, "Our common enemy is #COVID19, but our enemy is also an 'infodemic' of misinformation." This was followed by two policy briefs from UNESCO warning the world about the dangers of a "disinfodemic" ([Posetti and Bontcheva, 2020a,b](#)). [UNESCO \(2020\)](#) asserts, "COVID-19 has led to a parallel pandemic of disinformation that directly impacts lives and livelihoods around the world. Falsehoods and misinformation have proven deadly and sowed confusion about life-saving personal and policy choices" (para. 1). At a time when the world needed reliable and factual information to save lives, our information systems were flooded with "fake news," "alternative facts," and conspiracy theories. While misinformation and disinformation are nothing new, the popularity and design of social media platforms have created the perfect storm for the most sensational messages to go viral instantly. At the same time, these digital tools are being used by individuals and organizations to connect and build movements for political and social transformation, the power of information communication technologies has never been greater.

Between 2015 and 2019, the amount of time young people in the United States (US) spent watching videos every day doubled (Rideout and Robb, 2019, p. 5). Almost half of US teenagers surveyed, report that “they are online on a near-constant basis” (Anderson and Jiang, 2018, para. 2). In 2016, Stanford researchers assessed 7804 students across the US on their competence to analyze online media and found it “bleak,” reporting that students are “easily duped” and unprepared to distinguish between news and advertising, or to judge the reliability of a website (p. 4). They assert, “Never have we had so much information at our fingertips. Whether this bounty will make us smarter and better informed or more ignorant and narrow-minded will depend on our awareness of this problem and our educational response to it” (Stanford History Education Group, 2016, p. 5).

A crisis of trust

While we have access to far more information than ever before, we are trusting it less as researchers at Reuters Institute for the Study of Journalism surveyed people in over 40 countries and found that “fewer than four in ten (38%) say they trust most news most of the time” (Newman et al., 2020, p. 14). The increase in disinformation and unregulated media platforms and the decrease in trust of news media and the ability to distinguish credibility, require a new pedagogical response. Educational systems need to shift from traditional ideas of literacy that focus on a standard national language, emphasize skills-based functional literacies and memorizing facts to critical media literacy that addresses multiple communication systems and increasing linguistic and cultural diversity. Part of the requirement for being literate in the 21st century is being able to read and write images, sounds, multimedia, advertising, social media, and numerous other “multiliteracies” (New London Group, 1996). In Australia, Luke and Freebody (1999) created the *Four Resources Model* that lists the competencies necessary for being literate in a multimodal world: breaking the code of the text, participating in the meanings of the text, using texts functionally, and critically analyzing and transforming the text. Vasquez (2003, p. 15) explains:

Luke and Freebody assert that reading should be seen as a nonneutral form of cultural practice, one that positions readers in advantageous and disadvantageous ways. They argue that readers need to be able to interrogate the assumptions and ideologies that are embedded in a text as well as the assumptions that they, as sociocultural beings, bring to the text. This leads to asking questions such as, Whose voice is heard? Who is silenced? Whose reality is presented? Whose reality is ignored? Who is advantaged? Who is disadvantaged? These sorts of questions open spaces for analyzing the discourses or ways of being that maintain certain social practices over others.

The digital networked age brings challenges for which most educational institutions are unprepared. The majority of educators receive little training about how to promote critical thinking with their students in ubiquitous online cultures. In this essay, we discuss the potential of critical media literacy as a pedagogical response to our present-day needs. Critical media literacy combines a body of knowledge with a set of skills and dispositions to empower youth to critically analyze media, information, technology, and create their own alternative messages. This is especially important for educators working with second language learners because they are navigating multiple linguistic identities in different geographic and virtual sociocultural contexts, with an array of media (Meyrer and Kersch, 2021). This involves redefining second language instruction to include listening, speaking, reading, and writing all types of texts (digital and print) and necessitates critical analysis to question the connections between information and power.

Critical media literacy

There are many types of media education, some more focused on arts integration, others aiming to protect students from unsolicited media messages, and some simply including more types of media into traditional teaching (Kellner and Share, 2007). While these approaches can be useful for increasing media literacy skills, teaching critical media literacy means developing educators and students who embrace a critical way of looking at the world and questioning systems of power. This requires building critical awareness of how information communication technologies function within society, teaching skills for deconstructing and creating media, and developing a disposition for participating in a democratic process. Critical media literacy involves questioning the politics of representation, challenging oppressive ideologies, and creating counter-hegemonic media representations. Vasquez (2017, p. 6) reminds us that critical literacy should not be just a skill or topic to teach:

Instead it should be looked on as a lens, frame, or perspective for teaching throughout the day, across the curriculum, and perhaps beyond. What this means is that critical literacy involves having a critical perspective or way of being.

Critical media literacy offers a theoretical framework and pedagogical practice for critically analyzing information and creating alternative responses. Evolving from the multidisciplinary field of cultural studies, critical media literacy aims to expand our understanding of literacy to include reading and writing all kinds of texts (from printed books to movies, music, memes, social media, video games, websites, etc.), as well as deepen analysis to more critical levels that question the relationships between media and audiences, information and power. Critical media literacy integrates a body of knowledge and set of skills, as well as a framework

Table 1 Critical media literacy framework (Kellner and Share, 2019, p. 8).

Conceptual understandings	Questions
1. Social constructivism All information is co-constructed by individuals and/or groups of people who make choices within social contexts.	WHO are all the possible people who made choices that helped create this text?
2. Languages/semiotics Each medium has its own language with specific grammar and semantics.	HOW was this text constructed and delivered/accessed?
3. Audience/positionality Individuals and groups understand media messages similarly and/or differently, depending on multiple contextual factors.	HOW could this text be understood differently?
4. Politics of representation Media messages and the medium through which they travel always have a bias and support and/or challenge dominant hierarchies of power, privilege, and pleasure.	WHAT values, points of view, and ideologies are represented or missing from this text or influenced by the medium?
5. Production/institutions All media texts have a purpose (often commercial or governmental) that is shaped by the creators and/or systems within which they operate.	WHY was this text created and/or shared?
6. Social & environmental justice Media culture is a terrain of struggle that perpetuates or challenges positive and/or negative ideas about people, groups, and issues; it is never neutral.	WHOM does this text advantage and/or disadvantage?

Available in English, Mandarin, Portuguese, Spanish online: <https://guides.library.ucla.edu/educ466>.

of conceptual understandings (Buckingham, 2003). Based on the work of scholars and organizations around the world, the following Critical Media Literacy Framework (Kellner and Share, 2019, p. 8) includes six conceptual understandings and corresponding questions (see Table 1).

These conceptual understandings and questions are intended to guide educators and students along an inquiry process to interrogate all texts, mediums of communication, and the context that surround them. Livingstone (2018) states, “media literacy is needed not only to engage *with the media* but to engage *with society through the media*” (para. 3). It is not enough to teach with media, we must also teach about media and acknowledge that teaching about media can be a highly complex and multifaceted undertaking, especially when done through a critical media literacy lens.

Recognizing the need to embrace sociology, Luke and Freebody (1997) suggest educators should use more than just a psychological approach to literacy, because reading and writing is not just an individual cognitive process. They recommend bringing a sociological lens into the process of questioning the contexts, the dominant ideologies, and the systems that make some things seem “natural” or “normal.” Kovach and Rosenstiel (2011) assert, “Asking questions begins the process of deconstructing the media content we see in front of us. Critical thinking is not a formula—it is a journey” (p. 210). This journey according to Freire, (1970) requires dialectical thought, in which “world and action are intimately interdependent” (p. 38). Freire refers to combining theory with practice as *praxis*. When critical media literacy teaches students how to analyze media messages as well as create their own media and critically participate in media culture, students demonstrate their ability to read and write the word and the world (Freire and Macedo, 1987).

The critical media literacy framework is a holistic tool for thinking about and questioning the dynamic role media play in our relationships with ourselves, each other, and society. Accompanying this framework is a definition of critical media literacy created by the steering committee of the Critical Media Literacy Conference of the Americas (2021):

The goal of critical media literacy is to engage with media through critically examining representations, systems, structures, ideologies, and power dynamics that shape and reproduce culture and society. It is an inquiry-based process for analyzing and creating media by interrogating the relationships between power and knowledge. Critical media literacy is a dialogical process for social and environmental justice that incorporates Freire’s (1970) notion of praxis, “reflection and action upon the world in order to transform it” (p. 36). This pedagogical project questions representations of class, gender, race, sexuality and other forms of identity and challenges media messages that reproduce oppression and discrimination. It celebrates positive representations and beneficial aspects of media while challenging problems and negative consequences, recognizing media are never neutral. Critical media literacy is a transformative pedagogy for developing and empowering critical, caring, nurturing, and conscientious people.

Much of the theory behind critical media literacy has developed from cultural studies, a field of critical inquiry that began in the 1900s in Europe and continues to expand with new critiques of media and society. Researchers at the Frankfurt Institute for Social Research used critical social theory to analyze how media culture and the tools of communication technology induce ideology and

social control (Kellner, 1989). In the 1960s, researchers at the Center for Contemporary Cultural Studies at the University of Birmingham added to the earlier concerns of ideology with a more nuanced understanding of the audience as active constructors of reality (Hall, 2002, 2019). Kellner (2020) explains that cultural studies has continued to grow and incorporate concepts of semiotics, multiculturalism, feminism, critical race theory, queer theory, postmodernism, and other critical theories. Incorporating a dialectical understanding of textual analysis, political economy, and audience theory, cultural studies critiques media culture as dynamic discourses that reproduce dominant ideologies as well as entertain, educate, and offer the possibilities for counter-hegemonic alternatives.

Language acquisition

When considering language development, it can be helpful to distinguish the differences between acquisition and learning. The traditional view of language learning comes from behavioral psychology and promotes direct instruction that breaks language into component parts through drills and practice to learn vocabulary and grammar rules. In contrast, language acquisition emerges from cognitive psychology and prioritizes comprehensible input, the use of language in meaningful contexts, and a focus on comprehension and expression over correctness and skills (Freeman and Freeman, 2004). These ideas have been greatly influenced by Krashen's (1992) research and hypotheses about language acquisition.

Two of Krashen's hypotheses that can be supported by critical media literacy address the need for input that is comprehensible and learning environments that are low in stress and high in motivation. Krashen (1992) asserts that second language learners acquire the new language best when they receive input that is just a little beyond their ability level. This is similar to Vygotsky's (1978) *zone of proximal development*, a sweet spot that is not too difficult that the language cannot be understood, but not too easy so that there is nothing new to acquire (Moll, 1990). The *input hypothesis* (Krashen, 1992) calls for teachers to provide *comprehensible input* in which students can understand the majority of what they read or hear. "To ensure that the input is comprehensible, teachers can use pictures, gestures, tone of voice, and hands-on activities" (Freeman and Freeman, 2004, p. 38). Other researchers have also emphasized the importance of comprehensible output, so that students are producing and using language in meaningful ways (Gibbons, 2009; Nowbakht and Shahnazari, 2015; Swain, 1985).

These ideas align well with critical media literacy when students are creating media that is meaningful to them, thereby increasing their multimodal skills, deepening their critical thinking, and acquiring new language in the process. Many of the rules and linguistic features of the target language are more difficult for emergent bilinguals to learn, than they are for native speakers who hear and use it repeatedly all around them (Gibbons, 2009; Krashen, 1992). Another hypothesis that Krashen (1992) argues is important for acquiring a new language is the need to lower students' *affective filters*. When students feel anxious, scared, bored, or lack self-confidence their affective filter rises and prevents them from being able to acquire new language. In contrast, when they feel confident, engaged, and motivated, their affective filter is lowered and they are more capable of developing language. Students acquire language best when they receive relevant comprehensible input in meaningful and supportive situations. This is enhanced when an asset-based approach is used to counteract the deficit thinking that too often pervades educational institutions, especially with second language learners.

Asset-based vs. deficit-based approaches

Discourse surrounding deficit-based and asset-based terminology of students engaging in second language learning and acquisition has been debated globally for several decades (Martínez, 2018). Deficit-based terminology often occurs for second language learners when educators impose preconceived biases or assumptions upon students, suggesting that non-native speakers enter school lacking linguistic, cultural, and economic norms, skills, and familial support for their education (González et al., 2005; Valencia, 2010; Yosso, 2005).

In the US, deficit frames are often embedded within formal education through common labels used in schools. For example, deficit terminology, such as: *Limited English Proficient* (LEP) and *Former Limited English Proficient* (FLEP) positions the student as deficient and the English language as the preferred normative language, thus negating the values tethered to other cultural, racial, and ethnic identities, histories and languages. Currently, the term *English Language Learner* (ELL) or *English Learner* (EL) is widely used in second language research and by practitioners, yet there are increasing concerns that this label prioritizes English as a monolingual ideal and "can distort how we make sense of bi/multilingual students' everyday language practices, or ways of using language" (Martínez, 2018, pp. 515–516). Deficit constructs disproportionately harm students who are most marginalized by falsely implying that non-dominant identities do not hold valuable forms of knowledge. In this way, viewing students through an English monolithic lens does not acknowledge students' vast community and cultural wealth that they bring to the classroom, especially their linguistic assets (Yosso, 2005). Yosso (2005) describes "linguistic capital" as students' "intellectual and social skills attained through communication experiences in more than one language/style" (p. 78).

Valencia and Solórzano (2004) explain three deficit-based ideologies: genetic pathology thesis, culture of poverty model, and inadequate parents, home, and child model. The genetic pathology thesis promotes the idea that certain groups (often reflecting white supremacy) are biologically superior and others are genetically inferior. The culture of poverty model blames students' culture and lifestyle suggesting that people experiencing poverty are less capable of succeeding in school and society because they are poor. Lastly, is the deficit idea that parents/guardians, families, and home cultures do not care about their child's educational

achievement. Deficit thinking reinforces the myths that blame second language learners' biology, culture, or families instead of recognizing the systemic and structural causes that lead to inequities.

An alternative to deficit thinking is asset-based thinking that prioritizes the positive skills, knowledge, and experiences that students bring with them that rarely are appreciated or valued in schools. [González et al. \(2005\)](#) describe a *funds of knowledge* approach in which teachers reject the deficit paradigm and take a proactive role in validating and incorporating the positive assets students and their families possess in their daily household routines. This practice creates an opportunity for educators to interrogate and reject deficit-based thinking, forge positive collaborative relationships with learners and their families, and can be applied in classrooms by fusing students' familial knowledge into their curricular and pedagogical designs ([Moll, 2019](#)). By integrating students' funds of knowledge into the curriculum, classrooms are more likely to become *culturally relevant* ([Ladson-Billings, 1995, 2014](#)) while also increasing the amount of comprehensible input ([Krashen, 1992](#)).

Asset-based terminology disrupts problematic labels for second language learners. [García \(2009\)](#) asserts that the term *emergent bilingual* (EB) is a more inclusive asset-based term that respects the learner's "potential in developing their bilingualism; it does not suggest a limitation or a problem in comparison to those who speak English" (p. 322). Instead, this terminology disrupts deficit categorizations of students as limited English proficient (LEP) to emphasize the positive attainment of a second language. Emergent bilingual students navigate the development of two languages simultaneously, including their home language and their second language during language acquisition ([Gort et al., 2008](#)). When educators embrace students as assets, rejecting deficit ideas, students are more likely to feel welcome, self-confident, and valued, thereby lowering their affective filters and increasing their potential for acquiring new language. When critical media literacy guides students to analyze their media preferences, express their voices, and create media that are meaningful to them, emergent bilingual learners are prone to expand their linguistic dynamics through multi-cultural discourse ([Sherman, 2003](#)).

Putting theory into practice

Media literacy education is increasing around the world in multiple content areas and grade-levels, thus becoming an opportune pedagogy for second language learners ([Lim and Tan, 2020](#)). Analyzing and creating media can be a useful strategy for emergent bilinguals to learn and acquire grammar, phonics, syntax, semantics, and pragmatics, as well as comprehension and critical thinking. When analysis and production are critical of power and dominant ideologies, students are more likely to question and challenge deficit thinking, unjust representations, and disinformation.

There are many ways for second language teachers to integrate critical media literacy into their practice in all grade levels. Young emergent bilingual students can compare and contrast different versions of fables and fairytales, questioning portrayals of gender, race, class, and other identities found in books, cartoons, movies, websites, songs, or video games. Then they can collaboratively create their own media with alternative perspectives or different endings of the same story, taking the form of comic strips, memes, podcasts, digital stories, or photographs. Older emergent bilingual students can analyze news media to learn about how production techniques convey ideologies, bias, and credibility through narrative, imagery, and sound. Then they can create their own text as radio shows, blogs, animation, zines, movie trailers, books, or social media, to retell or repurpose the story from different perspectives and question hegemonic narratives. These critical media literacy activities also provide pedagogical opportunities for emergent bilinguals by making input comprehensible, content culturally relevant, lowering the affective filter, and increasing language acquisition.

Photography

While there is little research available on using photography with young emergent bilinguals, it is important to recognize that "Language does not develop as an isolated mode of communication. Its relationship with visual imagery is primal" ([Britsch, 2010](#), p. 171). Students can use cameras to record their lives outside of school, as well as construct meanings of academic words and ideas they are learning in the classroom. Reflecting on over 30 years of experience teaching elementary school, [Dragan \(2008, p. 41\)](#) explains that for emergent bilinguals, creating photography:

gives them a feeling of power and control over a piece of equipment, and that helps compensate for the lack of control they may feel over not yet speaking English. Photography gives my English language learners (ELLs) an additional language—another way for them to convey who they are and show what they know.

In Los Angeles, California, emergent bilingual fourth-grade students learned how to illustrate their vocabulary words with photography ([Share, 2015](#)). First, they took pictures that showed words they encountered in their textbooks. The activity began with a class discussion about the meaning of the word and the different ways they could show it in a single image. The student photographer had to tell classmates where and how to pose in order for the picture to communicate the intended meaning of the word. They analyzed photographs from newspapers and magazines and brainstormed a list of techniques that photographers use to convey feelings and ideas, such as camera angles, composition, and lighting. After a couple weeks, students were so

Fig. 1 Fourth-grade second language learners at an elementary school in downtown Los Angeles took pictures of each other to illustrate vocabulary words and created this palm-sized booklet with adjectives and synonyms.

enthusiastic about taking pictures that they began bringing their own words into the classroom. This sparked an activity in which whoever brought in a new word would get to take the picture illustrating that word or be in the picture. Because of the enthusiasm, students spent time every morning illustrating vocabulary words and generating a massive collection of new words. The digital images became a synonym/antonym flashcard game. Students wrote sentences or stories to accompany their photographs and then printed PowerPoint handouts that were folded into pocket-sized books and trading cards for each student. These personalized vocabulary cards and booklets were popular with students and their families, as well as powerful student-made teaching materials to increase their vocabulary and literacy skills (Fig. 1). This use of photography for learning different subject matter expands the understanding of literacy and opens the opportunity to critically analyze visual texts using the critical media literacy framework (see Table 1). For students from marginalized groups who are often under-represented and misrepresented in mainstream media, becoming the creators of their representations can be a step in the process of challenging deficit thinking and enacting their power.

Curriculum interventions

Refugees, immigrants, and emergent bilingual youth, often experience schooling as an exclusionary space that reinforces deficit-frames and funnels them into vocational tracks that rarely capitalize on their assets (Muhammad, 2020; Pérez Huber and Muñoz, 2021; Valenzuela, 1999). At the same time, commercial media often reproduce racist, sexist, classist, and nativist ideologies of refugees and other marginalized groups, appropriating their cultures, denigrating their experiences, and reinforcing harmful stereotypes (Yosso, 2020). Researchers in the Netherlands examined a critical media literacy intervention with young migrants run by a Dutch participatory action research project. They report on the value of critical media literacy in which teachers and students co-created curriculum that was situated on students' interests, assets, and needs (Bruinenberg et al., 2021). Bruinenberg et al. (2021) report that their predetermined curriculum undervalued the knowledge about social media that the migrant students already had, often more sophisticated than the educators. This suggests the importance of an asset-based approach that validates students' funds of knowledge and incorporates it into the curriculum design and implementation, thus making learning more culturally relevant.

In 2017, Brazil enacted legislation to require media analysis studies for children attending compulsory education given increasing public concerns about competing news media messages (Lim and Tan, 2020). Meyer and Kersch (2021) provide examples of 3rd-year high school students in an ESL class in Brazil participating in a critical media literacy intervention. Concerned with emergent bilingual students' exposure to "fake news" about the pandemic spreading on social media, educators decided with their students to critically analyze a viral video on WhatsApp and research multiple news sources. Students collaborated in critical dialogs, compared and contrasted multiple news articles and videos from international online newspapers, and constructed alternative journalistic articles in response to their analyses of news information about COVID-19. Students' processes of analyzing and responding to news articles about the pandemic yielded opportunities for them to read, write, and collaborate (orally and in written-formats) to increase their second language skills in English while also sharing more critical information in their native language. Meyer and Kersch (2021) report that using authentic multimodal texts related to students' lives helped them feel more connected with their language learning and empowered to be co-constructors of the curriculum. Students also demonstrated deeper critical thinking through questioning subsequent news articles and social media.

For 5 months during the pandemic, researchers in the Ukraine implemented a media literacy experiment with 138 1st-year students online in a university English as a Foreign Language (EFL) program (Bilotserkovets et al., 2021). The 70 students in the experimental group received media literacy lessons that led them to analyze social media for their language instruction. A control group of 68 students used the traditional EFL textbook for their lessons and received no media literacy instruction. The data from questionnaires, tests, and observations led Bilotserkovets et al. (2021) to conclude that the experimental group outperformed the control group in their development of media literacy skills and English-language proficiency. Researchers attribute much of the improvement to an increase in motivation from using English in authentic communication practices with social media and interactive ICTs (Bilotserkovets et al., 2021, p. 265). This case study provides an example of how reaching beyond the standard EFL textbook and analyzing social media can be important steps in the process of making EFL learning more engaging and relevant to students' lives.

Research studies

In an English as a foreign language program at a university in South Korea, Kim (2018) examined oral proficiency development using two types of movie clips, with and without sound. During a 12-week media literacy intervention with 62 low-proficiency EFL students, one group engaged with silent movie clips and the other interacted with movie clips with sound. Students analyzed and constructed digital stories to practice their listening comprehension and oral speaking skills about each film clip and provided feedback to their peers on their oral fluency (e.g., grammar, pronunciation, and summary skills). Pre and post tests indicate that the student group watching movie clips without sound were more confident to think critically and creatively, yet their listening comprehension was limited. Conversely, the group assigned movie clips with sound reported that their listening comprehension increased, but their critical thinking and creativity was limited. Kim's (2018) study coincides with Krashen's (1992) recommendations for teachers to increase comprehensible input through visual literacy to support emergent bilinguals' oral proficiency development, sometimes with sound and sometimes without. Taking this media literacy project to a more critical application could include asking questions about power and the politics of representation, as well as having students create alternative media that challenge the norms and ideologies they were seeing.

In a case study at Taipei University, in Taiwan, with four EFL students, Kung (2016) investigated whether using news broadcasts could increase students' communicative competencies and media literacy. First, the researcher assessed students' prior knowledge about the target vocabulary words from the video they were about to watch. Next, the teacher provided direct vocabulary instruction prior to their interaction with a CNN newscast. Students engaged with the newscast twice and took notes about events, main ideas, and vocabulary-in-context. Lastly, students completed an immediate oral language assessment to recount what they observed in the newscast (e.g., content, key points with examples, and a reflection) by creating a digital recording. Data revealed that all participants increased their application of target vocabulary with mild-to-full accuracy and improved their oral linguistic output. Kung (2016) recommends that second language teachers incorporate media texts mindful of comprehensible input relevant to students' interests to expand students' "practical and genuine linguistic input" (p. 337). Although this study has a small sample size, it contributes to the scant literature in Southeast Asia relating to second language approaches to teaching with media. While teaching *with* media is part of critical media literacy, it is also important to teach *about* media, such as deconstructing production techniques, analyzing positionality and bias, and questioning economic motivation, thus reinforcing the understanding that no message is neutral (Kellner and Share, 2019).

Also analyzing news media, university students in a Teaching English as a Foreign Language class in Bogotá, Colombia, learned media literacy through weekly radio workshops (Neiva-Montaña, 2021). Working collaboratively for eight weeks, 15 students analyzed a radio program from the BBC, role played as journalists interviewing each other, developed a survey for their social circles, researched topics of interest, and then created their own radio programs that were broadcast on the university radio station. Neiva-Montaña (2021) gathered qualitative data to assess the learning and found that the media literacy work encouraged oral interactions and assisted the students in making sense of complex concepts. She reports, "Bringing media messages to the classroom activated the students' critical thinking and transformed the learning language into a more meaningful experience" (p. 14). As the students used language together to solve problems, they were also applying Mercer's (2007) concept of "interthinking." Mercer (2007, p. 6) writes:

Language is designed for doing something much more interesting than transmitting information accurately from one brain to another: it allows the mental resources of individuals to combine in a collective, communicative intelligence which enables people to make better sense of the world and to devise practical ways of dealing with it.

Collaborating to solve real-world problems, made the students' experiences more meaningful and engaging than simply filling out worksheets or memorizing decontextualized information as often occurs in traditional EFL classrooms. Through analyzing news media and creating their own radio programs, these students were demonstrating the potential of media literacy for language learning, something that could be even further enhanced through a critique of ideology and power.

After his sixth-grade intermediate English as Second Language (ESL) students complained about their ESL textbook being boring and irrelevant, Mohammed Choudhury departed from the text and taught his students language skills through critical media literacy: analyzing dominant commercial media, interviewing community experts, questioning hierarchies of power, and creating their own counter-narratives (Choudhury and Share, 2012). His students encountered many negative stereotypes in the mainstream press about their community and people like them. They discussed the racism and injustice they were finding and decided to do their own investigation about their community by focusing on the assets that were rarely reported.

They embarked on walking field trips around their school, taking pictures and interviewing community members. Some people they interviewed in their primary language (Spanish) and then translated the interviews later in the classroom. Other people they interviewed in English and worked collaboratively to write notes and document the conversations. Students compared the positive information they learned about their community with the negative representations they found in the local news media. In an attempt to challenge the deficit messages they wrote essays and created multimedia presentations that valued the assets. Choudhury reports that his students benefited in numerous ways from increased self-esteem and pride in their community to higher test scores and greater language acquisition. By the end of the school year, “more than half of his students, 47 out of 72 (65.3%), were reclassified as English-Fluent-Proficient, well above the district norm of 13.4% for the sixth grade” (p. 43). Not only did their language proficiency increase, but Choudhury’s students learned to use language to critically examine the systems and structures of power and then exercised their agency by creating media that challenged deficit thinking and celebrated their community’s assets.

Conclusion

Critical media literacy provides a framework, disposition, and pedagogy to critique the social structures, systems, and representations that organize society and reproduce hierarchies of power. While the critical media literacy framework and examples listed above can be useful resources for recreating this in classrooms across the globe, education is a sociocultural process and should always be adapted and shaped for the particular context and needs of each student and learning environment. Students should be guided to question injustice and challenge oppression through critical media analysis and production, varying depending on the context. Second language learning through critical media literacy offers many benefits for emergent bilingual students such as: increasing comprehensible input, lowering affective filters, raising student engagement, using language in meaningful contexts, developing critical thinking, and expanding language acquisition. When educators integrate critical media literacy with second language learning, they provide authentic opportunities for emergent bilinguals to connect their funds of knowledge with all types of media, deepen their critical engagement, and use all their language skills to create more socially just alternative messages.

The English learner (EL) population continues to grow across the United States (US). Although EL populations are highly concentrated in states like California, Texas, and New Mexico, data reveals that EL populations are growing across most states each school year (US Department of Education et al., 2020). According to the US Department of Education et al. (2020) ELs made up 10.2% of students in public K-12 schools in 2018, which is about five million students; meanwhile, back in 2000 ELs made up 8.1% of students (US Department of Education et al., 2020).

Due to federally mandated statewide testing and the Every Student Succeeds Act (ESSA, 2015), educators are held accountable to ensure that ELs participate in the assessments and that ELs' academic performance improves over the years. However, since the inclusion of ELs in assessments many decades ago, a performance gap between ELs and their non-EL peers has been observed (Abedi and Sanchez, 2021). Changes to assessments have steadily increased the accessibility of assessments for ELs; however, there are still issues with current assessment practices because ELs continue to struggle to score at the same level as their peers. ELs underperform even in content assessments not related to English language skills (Abedi and Gándara, 2006) or when assigned test accommodations intended to increase the accessibility of the tests (Abedi, 2012; Abedi et al., 2020). With the growing EL population in mind, the need for reliable and valid assessments that are accessible to ELs across the nation increases.

In this chapter the authors will first summarize key aspects of ELs' performance on state content assessments including the reliability, validity, and accessibility of the tests. Next, the authors will discuss issues related to ELs and state content assessments. Although there are various aspects of statewide assessments pertaining to ELs that can be discussed, the authors have chosen three main issues related to the assessment of the EL student population: unnecessary linguistic complexity in content-based assessments such as math and science; the need for effective, valid, and research-based accommodations specifically adapted to assist the language needs of ELs; and the need for guidelines on how to assign accommodations to ELs. The authors will also discuss the validity of the dichotomous EL/non-EL classification. By targeting these main issues, ELs may improve their performance on statewide content assessments and, most importantly, ELs' content knowledge may be more accurately assessed and evaluated.

ELs' performance on state content assessments

ELs tend to perform lower on assessments with higher language demands (Abedi, 2002). The 2019 National Assessment of Educational Progress (NAEP, 2021a) scores revealed a statistically significant 24-point gap between grade 4 ELs and non-ELs on the math section, with ELs performing lower than their non-EL peers. NAEP grade 4 math test results showed that 44% of non-ELs score proficient or above, while only 16% of ELs score proficient or above (NAEP, 2021b). On the reading section, ELs significantly underperform at a higher degree than in math. To compare, NAEP grade 4 reading results revealed a 33-point gap difference between ELs and non-ELs in grade 4 (NAEP, 2021c). This resulted in 39% of non-ELs scoring proficient or above on the NAEP reading sections, while only 10% of ELs scoring proficient or above (NAEP, 2021d). The clear difference between ELs' scores on the math and readings sections reveals the way ELs' limited English proficiency affects test performance.

Various studies have also found that non-ELs outperform ELs on content assessments. For example, [Turken and Liu \(2012\)](#) found that this is true on a science test administered to non-ELs and ELs in California. The researchers found a moderate performance difference between the two EL groups that proved to be statistically significant. To add, [Miley and Farmer \(2017\)](#) compared the state standardized assessment scores between ELs and non-ELs in Tennessee and found similar findings where ELs significantly underperform on both English language arts (ELA) and math sections. The researchers took it one step further by creating a third student subgroup, recently reclassified ELs, which was indicated by exit criteria on the state's English language proficiency assessment. [Miley and Farmer \(2017\)](#) found that recently reclassified ELs underperform compared to their non-EL peers. Similarly, data from California shows that although reclassified students perform higher than current ELs, reclassified students still do "not outperform English-only students" ([Hill, 2018](#)). It is clear that students' level of English proficiency influences test scores even on subject areas not directly assessing English language skills.

Reliability and validity of state content assessments
